Dave, correct, the engine didn't turn on during the CD tests but I think it may come on during on-road driving if the load request is high enough.

Subject: FW: Audi A3 e-tron ultra - Is it a blended or non-blended (parallel) PHEV?

Jim,

When you tested the vehicle was it blended or non-blended?

My notes from an 11/20/2013 meeting indicate it was a parallel (blended) PHEV but the engine didn't come on during UDDS and Hwy testing.

[The label format is for a non-blended PHEV.]

Subject: Audi A3 e-tron ultra

Hi Dave;

As your requested, attached is a sample of the fuel economy label for the 2106 Audi A3 e-tron ultra. Please let me now if you have any concerns and that all the required data has been properly displayed. The factory has told me that it is a non-blended PHEV, I believe this point was already pointed out to EPA in an A3 e-tron presentation in early August.

Best regards,

Richard

Chris - your schedule is so busy next week that I recommend you not take this meeting. But, do you have any desire to meet with Mr. Heil? Let me know.

Jim

Subject: FW: Meeting request for German Member of Parliament, Mr. Hubertus Heil on October 21

Chris/Jim,

The requests related to Volkswagen continue to come in. This particular request comes from a German Member of Parliament who long planned his mission here to promote trade with the U.S. Since he has a lot of Volkswagen employees in his district, it is now difficult for him to come to Washington without some sort of meeting related to Volkswagen. His request was not very specific. The German Embassy pressed him on this and he seems more interested in being able to say that he had a meeting than in addressing any specific issue related to the monitoring and testing.

If OTAQ decides to take this meeting, it would not have to be at a high level. I have explained that it might be difficult to schedule but that I would make the inquiry.

Mark

Subject: Meeting request for German Member of Parliament, Mr. Hubertus Heil on October 21

Dear Mark,

My colleague Michael Weber forwarded your email address to me. May I contact you today with another meeting request?

Mr. Hubertus Heil, Member of the German parliament and Deputy Chairman of the Social Democratic Party's (SPD) Parliamentary Group, will be in Washington next week. Responsible for Economic Affairs and Labour within the Parliamentary Group he is interested in exchanging thoughts about the latest developments regarding Volkswagen. Being the Representative of the district of Gifhorn - Peine an area close to Wolfsburg where many employees working for Volkswagen live, Mr. Heil's meeting request comes with a more "personal" approach.
While Mr. Heil is also very keen to know more about the EPA's plans to further improve monitoring standards and testing he's perfectly aware that in light of the ongoing investigation enforcement issues could only be discussed in a general way. However he would be delighted to raise this point as well.

Given his short time of visiting Washington DC a meeting preferably on October 21 would be best although there might be some flexibility regarding the next day (October 22).

Please find a short bio of Mr. Heil attached.

I am looking forward to hearing from you.

Thank you,

Ulrike

Volkswagen could have new emissions control problem

By Timothy Cama - 10/14/15 11:34 AM EDT

Government officials are investigating a newly disclosed emissions software feature that could help Volkswagen Group vehicles to pass government tests, the company said.

In a statement to The Associated Press, Volkswagen Group said Wednesday that some 2016 model-year diesel vehicles have an "auxiliary emissions control device," which the company said is different from the "defeat devices" that have landed the automaker in major international trouble in recent weeks.

The new issue causes a pollution control catalyst to better break down nitrogen oxide emissions by heating up faster, the AP said.

The Environmental Protection Agency (EPA) and the California Air Resources Board have delayed approving some 2016 diesel models from Volkswagen while they investigate the new software feature.

"We have a long list of questions for VW about this," said Janet McCabe, acting assistant administrator of the EPA's air pollution office. "We're getting some answers from them, but we do not have all the answers yet."

McCabe declined to say whether the feature, or Volkswagen's failure to disclose it, is illegal.

The EPA discovered that Volkswagen used a software workaround to make its cars emit less nitrogen dioxide during tests than during regular use, which could subject the company to $18 billion in fines.

VW Scandal: Executive Tapped As New Volkswagen North America Chief, Winfried Vahland, Suddenly Quits

By Angelo Young @angeloyoung_ a.young@ibtimes.com on October 14 2015 12:07 PM EDT

Thanks, but no thanks. Less than three weeks after Winfried Vahland was named Volkswagen Group's head of North American operations, the former head of Volkswagen-owned Skoda Auto has made an about-face and is leaving the company.

The abrupt announcement comes a day after the German auto giant announced major development changes, including more focus on electric cars, and major spending cuts to Volkswagen-branded car development.

"Differing views on the organization of the new Group region have led to this decision," Skoda said in a statement released Wednesday, referring to the newly formed North American

corporate structure that places one executive in control of the company's U.S., Canada and Mexico operations. Volkswagen Group owns a dozen auto brands, including Audi, Porsche and SEAT. "This decision is expressly not related to current events on the issue of diesel engines."

The world's largest automaker by sales volume is struggling with an emissions-test cheating scandal that has it facing billions of dollars in fines, a raft of class-action lawsuits, federal and state investigations and a costly, time-consuming recall process set to begin early next year.

On Wednesday the German weekly Der Spiegel said at least 30 company managers were involved in the scandal in which about 11 million small-engine diesel cars were built to dodge emissions standards. About 482,000 of these cars are in the United States.

New York Times:

http://www.nytimes.com/2015/10/15/business/international/new-volkswagen-chief-for-north-america-winfried-vahland-resigns.html?_r=0

New Volkswagen Chief for North America, Winfried Vahland, Resigns

By MELISSA EDDYOCT. 14, 2015

BERLIN — A senior Volkswagen executive who was recently tapped to take over the company's North American division is instead leaving the company after 25 years.

In announcing the departure of the executive, Winfried Vahland, the company said Wednesday that he was leaving over a disagreement about how to structure the North American operations. The company specifically said that his departure had nothing to do with the diesel-emissions scandal that is preoccupying Volkswagen.

But the development only adds to the turmoil at Volkswagen, which is the subject of

investigations on both sides of the Atlantic, including inquiries by the United States Justice Department and state prosecutors from Lower Saxony in Germany.

Mr. Vahland, who had been the chief of Volkswagen Group's Skoda unit, was appointed on Sept. 25 to lead Volkswagen's newly reorganized North America division. It was part of a shake-up that followed the resignation of Volkswagen's chief executive, Martin Winterkorn, after the company admitted installing software designed to trick diesel air-quality tests and that was installed on 11 million vehicles worldwide.

Several executives have been suspended in connection with Volkswagen's investigation into the fraud, although the company has refused to release any details. On Wednesday, the company said that reports in the German news media that "several dozen" managers had been involved were inflated.

Mr. Vahland had been expected to take up a position that would have placed overall responsibility for the automaker in the United States, Mexico and Canada in his hands. But because of "differing views on the organization" of the new division, "expressly not related to current events on the issue of diesel engines," he decided to leave the company, a company statement said.

Before taking over Skoda, which is based in the Czech Republic, Mr. Vahland served in various posts at Volkswagen. In 2005, he helped start a major expansion of Volkswagen in China, and he was considered one of the company's most senior executives.

In announcing the reorganization of its operations in North America last month, Volkswagen said that Mr. Vahland would "combine and significantly strengthen" the new North America division. Existing executives, including the company's top executive in the United States, Michael Horn, would have remained in place, but they would have reported to him.

2016 VW diesels have new software affecting emissions tests

Posted: Wednesday, October 14, 2015 10:15 am

WASHINGTON (AP) — Volkswagen has disclosed to U.S. regulators that there is additional suspect software in its 2016 diesel models that would potentially help their exhaust systems run cleaner during government tests.

Volkswagen confirmed to The Associated Press that the "auxiliary emissions control device" at issue operates differently from the "defeat" device software included in the company's 2009 to 2015 models disclosed last month. That disclosure triggered the worldwide cheating scandal engulfing the world's largest automaker.

The newly revealed software makes a pollution control catalyst heat up faster, improving performance of the device that separates smog-causing nitrogen oxide into harmless nitrogen and oxygen gases.

VW spokeswoman Jeannine Ginivan said the new issue with the 2016 vehicles was first revealed last week to U.S. Environmental Protection Agency and California regulators.

"Volkswagen has disclosed, in the application process for the model year 2016 2.0 TDI models, an auxiliary emissions control device," Ginivan said. "This has the function of a warmup strategy which is subject to approval by the agencies. The agencies are currently evaluating this and Volkswagen is submitting additional information."

AP first reported last week that the EPA and California Air Resources Board are investigating "the nature and purpose" of additional software on the new VW models. Regulators have not yet determined whether the code is a defeat device installed specifically to cheat on emissions tests, said Janet McCabe, acting assistant EPA administrator for air quality.

"We have a long list of questions for VW about this," she said Tuesday at a dedication ceremony for a new heavy-duty truck testing lab in Ann Arbor, Michigan. "We're getting some answers from them, but we do not have all the answers yet."

Volkswagen already faced an ongoing criminal investigation and billions in fines for violating the Clean Air Act for its earlier emissions cheat, as well as a raft of state investigations and class-action lawsuits filed on behalf of customers.

If it is determined the new issue is a second defeat device, that would call into question recent assertions by top VW executives that responsibility for the cheating scheme lay with a handful of rogue software developers who wrote the original code installed with the company's diesel engines starting with the 2009 model year.

The separate device included in the redesigned 2016 cars would appear to suggest a multi-year effort by the company to influence U.S. emissions tests that continued even after regulators began pressing the company last year about irregularities with the emissions produced by the older cars.

A congressional staffer briefed on the issue last week told AP that VW probably didn't need the additional software to meet government emissions standards, but that the device appears intended to ensure the 2016 cars would pass by wider margins. The staffer spoke on the condition of anonymity because he was not authorized to talk publicly about the ongoing investigation.

The company's most senior U.S.-based executive announced in congressional testimony last week that the German automaker had withdrawn applications seeking certification of its 2016

diesels because of on-board software that hadn't been disclosed to regulators.

However, the statement by Volkswagen of America CEO Michael Horn left unclear whether the issue with the 2016 models was the same as that in the earlier models, or whether it potentially constituted a new violation. Manufacturers are required by law to disclose any devices affecting emissions controls as part of the process to receive the EPA certifications required to sell the cars in the country.

EPA's McCabe wouldn't say if VW's failure to disclose the software in its 2016 application for emissions certification was illegal. "I don't want to speak to any potential subjects of an enforcement activity," she said.

VW is now working with regulators to continue the certification process needed to sell the 2016 diesel cars.

The delay is bad news for Volkswagen dealers, who had been anticipating delivery of the new models to replace older inventory which they can no longer offer to customers. Thousands of 2016 Beetles, Golfs, Jettas and Passats will remain quarantined in U.S. ports until a fix can be developed, approved and carried out.

—

Matthew Daly contributed from Washington. Krisher reported from Ann Arbor, Michigan.

Fortune

http://fortune.com/2015/10/14/dozens-of-managers-implicated-in-volkswagen-scandal/

"Dozens" of managers implicated in Volkswagen scandal

by Geoffrey Smith

OCTOBER 14, 2015, 10:37 AM EDT

And there's more woe for VW as the designated head of its new North America region refuses to take up post.

The external investigation that Volkswagen AG VLKAY 0.41% commissioned is making alarmingly quick (and leaky) progress.

According to the German magazine and website Der Spiegel, the circle of managers with direct knowledge of how the company falsified the emissions performance of its diesel vehicles is much wider than the company had so far indicated. Last week, Michael Horn, head of the company's U.S. operations, had told a Congressional committee that the decision to install "defeat devices" that masked the actual level of emissions was taken by a small group, and wasn't a corporate decision.

Der Spiegel cited company sources as saying that "at least 30 people" were involved in the scandal, and that the final number may be higher. Earlier this month, VW's board had commissioned law firm Jones Day LLC to conduct an investigation into the affair, promising a rigorous clean-up. Spiegel's story referred to the first preliminary findings of that investigation. These aren't being made public yet.

It wasn't clear whether the company had suspended any more employees. According to media reports, the senior R&D managers at the group's three leading brands, VW, Audi and Porsche, have all been suspended while the investigation goes on.

A spokesman for Volkswagen didn't immediately respond to a request for comment.

In separate news Wednesday, it emerged that Winfried Vahland, who was slated to take over as head of the VW group's new North American division, is to leave the company at his own request.

The new structure was unveiled at the first board meeting after the resignation of CEO Martin Winterkorn, and was aimed at devolving more power away from the group's headquarters in Germany.

Škoda, the low-end, Czech-based unit of VW which Vahland has run for the last five years, said "differing views on the organisation of the new Group region have led to this decision." It added that it is "expressly not related to current events on the issue of diesel engines."

Vahland had been with the VW group for 25 years, and had run Czech-based Škoda since 2010. Before that he had been head of VW's regional operations in China. According to some reports, Winterkorn had pressed for Vahland to succeed him as CEO.

After pollution scandal, Volkswagen to focus on electric vehicles

October 14th, 2015 by Associated Press

The all-new Chattanooga built VW Passat TDI cruises on East Brow Road atop Signal Mountain early Wednesday afternoon. Staff photo by Dan Henry/Chattanooga Times Free Press

Volkswagen says it will shift its focus toward developing electric cars.

It aims to develop new hybrid and electric vehicles in response to its emissions scandal.

The new steps were part of a plan to confront the company's scandal over cars that were equipped with computer software that let them evade U.S. emissions tests.

Volkswagen division head Herbert Diess said in a statement Tuesday the company would change its approach to diesel emissions in Europe and North America and adopt so-called selective catalytic converter technology, or SCR. That is a system that injects the chemical substance urea into the exhaust stream to neutralize harmful nitrogen oxides.

He said that change would come "as soon as possible."

Diess also said the company would reduce spending on investments by 1 billion euros ($1.1billion) and redouble efforts to cut other costs.

Volkswagen will expand its modular construction system — which involves sharing technical specifications and parts across different models to save money — to include new plug-in hybrid and electric vehicles.

The company additionally plans to turn the next version of its large Phaeton luxury sedan into an electric-only vehicle to demonstrate the company's technological competence.

The Phaeton, a project introduced by former CEO Ferdinand Piech, has been criticized as a money-loser. The Piech and Porsche families own the majority of voting shares in Volkswagen through a holding company.

"The Volkswagen brand is repositioning itself for the future," Diess said in a statement. "We are becoming more efficient, we are giving our product range and our core technologies a new focus, and we are creating room for forward-looking technologies by speeding up the efficiency program."

Diess is a recent hire from competitor BMW, where he oversaw development of new models including the i3 electric and i8 plug-in hybrid vehicles.

Volkswagen AG, whose other brands include Audi and Skoda, is facing a crisis after U.S. authorities said it evaded emissions checks on 482,000 vehicles. The company has set aside 6.5 billion euros ($7.3 billion) to cover the costs of recalls and fines. But analysts say the costs in terms of fines and lost sales will likely be considerably higher.

Earlier, the governor of Germany's Lower Saxony state, which holds a 20 percent stake in Volkswagen, said the automaker should have admitted earlier that it manipulated emissions data in the U.S. Volkswagen acknowledged the deception to U.S. regulators on Sept. 3, more than a year after researchers published a study showing the real-world emissions of two VW models were far higher than allowed.

Governor Stephan Weil told Lower Saxony's state legislature on Tuesday that "this confession should clearly have come a great deal earlier — another serious mistake," news agency dpa reported.

Weil sits on Volkswagen's board of directors. He has said that the state's representatives were "completely surprised" by the emissions scandal and vowed to work to protect jobs.

Volkswagen North America Chief-Designate Quits

Winfied Vahland was head of Skoda brand

By SARAH SLOAT

Oct. 14, 2015 9:05 a.m. ET

FRANKFURT— Volkswagen AG parted ways with another senior executive Wednesday. Winfried Vahland is leaving the company due to differences over the auto maker's North America organization, which he was poised to oversee.

The automotive group, in the grips an international emissions-testing scandal, had designated Mr. Vahland, currently the head of Volkswagen's Czech Republic-based Skoda brand, as the new chief of its North America business last month.

"This decision is expressly not related to current events on the issue of diesel engines," Skoda said in a statement. Skoda said Mr. Vahland is leaving at his own request.

Volkswagen has been in disarray since mid-September, when it admitted to using software in millions of diesel cars that allow them to run cleaner in emissions tests than on the road. The disclosure, which came first for cars sold in the U.S., triggered a boardroom reshuffle, a profit warning and cutbacks in investment spending.

The group's supervisory board elected Hans Dieter Pötsch, the company's 64-year-old chief financial officer, as chairman last week, filing a post left open since April when former patriarch Ferdinand Piëch resigned. Matthias Müller, head of Volkswagen's Porsche brand, had replaced Martin Winterkorn as Volkswagen's CEO after Mr. Winterkorn resigned last month in the wake of the diesel-engine scandal.

USA Today:

http://www.usatoday.com/story/money/cars/2015/10/14/new-volkswagen-north-america-chief-winfried-vahland-out-after-three-weeks/73916418/

New Volkswagen North America chief Winfried Vahland out after three weeks

Nathan Bomey, USA TODAY 9:19 a.m. EDT October 14, 2015

Volkswagen's newly appointed head of North America is leaving the company less than three weeks after he was assigned to that position, injecting a new measure of instability as the company navigates an emissions scandal.

The sudden exit of Winfried Vahland gives the company's sweeping restructuring of its global operations a discombobulated feel, raising further questions about the future of its business in the U.S.

Vahland and Volkswagen had "differing views" on the company's new structure, the automaker said in a statement. His exit is "expressly not related" to the emissions scandal, VW said.

Vahland's swift appointment as head of the new North America region on Sept. 25 was billed as critical to creating a cohesive strategy for Volkswagen in one of the company's few weak spots. It came just a week after the U.S. Environmental Protection Agency exposed the fact that Volkswagen had installed software on vehicles to cheat emissions tests.

The company's U.S. chief, Michael Horn, who was set to report to Vahland, is staying in his current role.

Volkswagen did not immediately name a successor for Vahland, who also led Volkswagen's China operation for a period and was most recently chairman of the Skoda brand.

"In the last 25 years, Professor Vahland made a great contribution to the company," Volkswagen Group CEO Matthias Mueller said in a statement. "We respect his decision and thank him for his exceptional performance."

AP

Recently named head of VW North America will not take post

By DAVID McHUGH and TOM KRISHER

Oct. 14, 2015 9:38 AM EDT

FRANKFURT, Germany (AP) — The recently named head of Volkswagen's North American business won't be taking up his new job - and has left the company.

The announcement comes as Volkswagen faces a scandal over rigging the results of emissions testing of its diesel vehicles in the U.S. It means that one of the company's most experienced managers will not be coming to lead the company's response in the United States as it faces possible heavy fines from the Environmental Protection Agency.

Volkswagen's Skoda division made the announcement about its chairman, Winfried Vahland, in a news release on Wednesday.

The release said that Vahland will not be moving to take over his new position carrying overall responsibility for North America. It said his decision to quit was not related to the scandal over the diesel engines.

On Sept. 24, Volkswagen announced a reorganization of its North American operations that put Vahland over country executives including Volkswagen's U.S. chief, Michael Horn. The announcement came the same day Volkswagen named Matthias Mueller as CEO after Martin Winterkorn stepped down from the job.

VW had said Horn would remain as president and CEO of Volkswagen Group of America, but its U.S., Canada and Mexico markets will be "combined and significantly strengthened" to form a new "North America region" led by Vahland.

Vahland, the former head of VW's crucial China business, was leaving because of "differing views on the organization of the new group region."

Mueller thanked him for 25 years of service and a "great contribution to the company."

"We respect his decision and thank him for his exceptional performance," Mueller was quoted as saying in the Skoda statement.

Skoda, based in the Czech Republic, is one of VW's brands, which also include Audi, SEAT, Lamborghini and Bentley.

Forbes:

http://www.forbes.com/sites/beltway/2015/10/13/how-a-carbon-tax-could-have-prevented-the-volkswagen-diesel-scandal/2/

How A Carbon Tax Could Have Prevented The Volkswagen Diesel Scandal

Howard Gleckman, CONTRIBUTOR

If anyone needed another example of why a carbon tax is a good idea, look no further than Volkswagen's diesel scandal. The automaker's efforts to game the current system are a case study in what's wrong with government attempts to reduce pollution with regulation and tax subsidies, rather than through a relatively straight-forward tax on carbon-based fuels.

The current system is complex mix of environmental carrots and sticks. The sticks include regulation such as fuel economy standards. The carrots include tax subsidies. One was the (now-expired) alternative motor vehicle tax credit that was available to specific models that met detailed fuel economy requirements. Two models of VW Jettas qualified for credits of $1,300 and the LA Times reported in September that the government paid as much as $51 million in credits to buyers of VW diesel cars.

Unable to limit emissions, give consumers the high performance they want, and meet fuel economy standards, VW cheated. As you know by now, the firm installed software in its diesel cars designed to fool routine emissions tests—which made the cars appear "cleaner" than they really were. In all, VW reportedly sold 500,000 cars in the US from 2009-2015 with the rogue software. Here is a helpful description from Vox explaining the whole sad story.

VW eventually got caught, of course. It faces penalties from EPA and potential criminal charges for violating the False Claims Act, as well as an investigation by the Senate Finance Committee. CEO Martin Winterkorn has resigned and the firm has stopped selling diesel cars in the US.

Still, a lot of this mess could have been avoided with a carbon tax. Such a levy could replace many—though not all– of these complex rules and eliminate most incentives for gaming. A carbon tax would not help reduce local air pollutants such as NOx so it would not replace all auto pollution regulations. But it could supplant those that aim to reduce carbon emissions from vehicles.

For drivers, the choice would be relative simply: You buy a carbon-based fuel, you pay a tax. The more carbon in the fuel, the more tax you pay. The manufacturer wouldn't need to hit a mandated fuel economy standard. No-one would need to worry about conflicting regulations.

Instead, consumers would likely respond to higher taxes by demanding cars that, one way or

another, use less carbon-based fuel. We have lots of evidence that consumers are extremely responsive to changes in gasoline prices—the price goes up, they buy Priuses; it goes down, they switch to less fuel-efficient vehicles.

And with a big carbon tax, manufacturers will probably respond to consumer demands by producing low-carbon vehicles. The proof will be at the pump. If an automaker lies about its fuel efficiency, it will be immediately obvious: Consumers will be filling up their tanks more often than they expected. And government won't have to test carbon emissions from tens of millions of cars. It will just need to calculate the carbon content of their fuel.

There is one other classic argument for corrective taxes such as a carbon tax. Such a levy provides ongoing incentives for firms to enhance technology and continue to drive down emissions. But with regulation or subsidies, even honest producers are more likely to hit the mandated target—and stop.

This is not to suggest that carbon taxes are not without their own complex issues. My Tax Policy Center colleagues Donald Marron and Eric Toder have described some of the technical challenges. But overall, market mechanisms such as carbon taxes (or a cap-and-trade system) are far more efficient, and much less prone to cheating, than a system based on regulations and subsidies.

Volkswagen's Designated North America Chief Leaves Carmaker

Christoph Rauwald

October 14, 2015 — 8:58 AM EDT

Volkswagen AG's designated North America chief turned down the job in the wake of a management revamp triggered by the diesel-emissions scandal.

Winfried Vahland, a company veteran who currently leads VW's Czech Skoda unit, decided to not take over the new post as had been planned and will leave the carmaker, Skoda said in an e-mailed statement.

Vahland was among the candidates to succeed former VW Chief Executive Officer Martin Winterkorn, who resigned last month, but the supervisory board favored former Porsche chief Matthias Mueller. Vahland is leaving Wolfsburg, Germany-based Volkswagen at his own request. His departure is unrelated to the investigations into the rigging of millions of diesel engines worldwide, Skoda said in the statement.

Volkswagen said Tuesday it will reduce annual investment by about 1 billion euros ($1.1 billion) at its namesake car brand as the automaker steps up a cost-cutting push to weather the impact of the diesel-emissions scandal.

VW is under increasing financial strain following revelations last month that it rigged diesel engines to circumvent emissions regulations. The company set aside 6.5 billion euros for repairs and to compensate customers, but has said that won't be enough. VW faces numerous lawsuits in the U.S., where it has lost money and struggled to become more than an also-ran despite rapid expansion elsewhere.

Vahland was appointed head of VW's North American operations as part of a restructuring plan pushed by Mueller and meant to shift more responsibility to brand and regional managers. VW wasn't immediately available to comment on whether it still planned to fill the post.

Business Insider:

http://www.businessinsider.com/r-bosch-sees-diesel-market-so-far-unharmed-by-volkswagen-scandal-2015-10

Bosch sees diesel market so far unharmed by Volkswagen scandal

RENNINGEN, Germany (Reuters) - German automotive supplier Robert Bosch [ROBG.UL] has not seen any change so far in the diesel car market as a result of an emissions scandal that has rocked Volkswagen , its chief executive said on Wednesday.

"It will depend, though, on an active campaign for diesel to quickly dispel the current uncertainty that many consumers are feeling," Volkmar Denner told reporters at the opening of a new research center in the German town of Renningen near Stuttgart.

German Economy Minister Sigmar Gabriel warned against condemning diesel technology overall but said Germany needed to do better in switching to alternative engines.

He said he favored introducing incentives to reduce the price difference between electric and conventional cars.

Volkswagen, Europe's largest carmaker, last month admitted to cheating U.S. diesel emissions tests, sparking a crisis that unseated its CEO and wiped around a quarter off its market value.

Bosch is the maker of a popular diesel engine management program used by several top automakers including VW, which U.S. officials said last week was not preprogrammed to detect when a vehicle was undergoing laboratory emissions testing.

But it is not clear what role Bosch played, how closely it worked with VW to modify the engine management software and how much it knew about VW's intentions to use software to cheat on emissions standards.

Denner declined to comment on the matter.

He added that VW had not started talks to demand lower prices, following a media report that VW planned to extract 3 billion euros in price cuts from its suppliers to help mitigate the costs of the scandal.

Detroit News:

http://www.detroitnews.com/story/business/autos/2015/10/13/ann-arbor-epa-lab-diesel-tests-vw-scandal/73888296/

Ann Arbor EPA lab tests other cars after VW scandal

Michael Martinez, The Detroit News 5:05 p.m. EDT October 13, 2015

Ann Arbor — The Environmental Protection Agency on Tuesday said it's begun testing other automakers' vehicles in the wake of Volkswagen AG's massive diesel-testing scandal. Some of those tests are being done at the agency's emissions testing lab in Ann Arbor.

Janet McCabe, assistant administrator of the EPA's office of air and radiation, said the agency is "upping our game" following VW's admission last month that it cheated on emissions tests for more than 11 million diesel cars worldwide. The EPA said late last month it would conduct more spot checks of light-duty cars and trucks, testing vehicles owned by individuals and rental companies in real-world driving conditions. The EPA also could take cars from manufacturers' assembly lines.

"We're focused on diesel right now, but ... we're becoming the unpredictable EPA, so we'll be testing a range of vehicles with a range of configurations and situations," McCabe told reporters at a Wednesday technology showcase event.

The EPA sent letters to automakers late last month, warning that it will take further steps to prevent fraud. New safeguards will "detect any kind of defeat devices" that might turn off pollution-control equipment, Chris Grundler, the head of the EPA's office of transportation and air quality, said. He called the new tests part of an "evolution" of enforcement.

McCabe declined to say if the agency discovered that any other automakers have used defeat devices. "When we finish that process we'll be able to talk about the results," she said.

The California Air Resources Board and Environment Canada also are conducting real-world vehicle emissions testing, and all three facilities plan to share the results.

McCabe said the EPA isn't necessarily looking at software that could potentially trigger the defeat devices, which VW used to evade tests on its diesel vehicles.

"Our focus is on what's coming out of the tailpipe, which is how our standards are set and what the cars need to be measured up against," she said. "What we're focused on is whether they meet the standards that are in our rules."

McCabe was in Ann Arbor Wednesday to celebrate the launch of the EPA's new heavy-duty truck chassis dynamometer, a $3 million piece of equipment built in Germany that allows the agency to perform emissions tests on full-size heavy-duty trucks. Previously, the EPA had to spend about a week removing truck engines to run the tests.

The new dynamometer is housed in part of the agency's 200,000-square-foot National Vehicle & Fuel Emissions lab in Ann Arbor. The lab includes a number of emissions testing rooms that run simulations on cars, trucks and even small equipment like lawn mowers in a wide range of climates and conditions

EPA hasn't decided if new software on 2016 VW diesels is legal

ANN ARBOR, MICH. | BY PAUL LIENERT

U.S. regulators haven't determined the legality of a new emission-control device on Volkswagen's (VOWG_p.DE) 2016 diesel models, a top official said on Tuesday.

Those models still have not been certified for sale by the U.S. Environmental Protection Agency.

The existence of the new software was made public last week by VW's top U.S. executive in testimony to a congressional subcommittee investigating the German automaker's diesel cheating scandal.

The company has not confirmed speculation that the new software was configured before the wider emissions scandal broke on Sept. 18.

"We have a long list of questions for VW," said EPA Assistant Administrator Janet McCabe at a media briefing here. "When we have all of the answers, we will be able to make a determination" on the whether the device is legal or considered to be a "defeat device" designed to circumvent U.S. emission rules.

VW last month admitted that it installed illegal software on its 2009-2015 U.S. diesel models that enabled the cars to pass laboratory tests, but dump higher-than-legal limits of pollutants in real-world driving.

VW told regulators only recently that some of its U.S. diesel models included a previously undisclosed software feature that could affect emission controls on the 2016 models, according to Michael Horn, president and CEO of Volkswagen Group of America. Horn told U.S. lawmakers last week that the company subsequently had withdrawn its application for EPA certification of its 2016 diesel models.

Asked for additional detail, a VW spokesperson on Monday said the software "has the function of a warmup strategy which is subject to approval" by EPA. Typical diesel emission control systems are designed to be most effective when the engine is warmed up.

The EPA defines such software as an "auxiliary emission control device," or AECD, and describes it as any device that can change the operation of the vehicle's emission control system.

The agency also requires automakers to disclose the existence of such a software device, including "a rationale for why it is not a defeat device."

VW on Monday said the EPA is evaluating the new software device, and that the automaker is "working with the regulators to continue the 2016 certification process" for VW vehicles equipped with the 2.0-liter diesel engine.

Daily Caller:

http://dailycaller.com/2015/10/13/volkswagen-lobbied-obama-administration-for-green-tax-credits/

Volkswagen Lobbied Obama Administration For Green Tax Credits

STEVE BIRR

11:41 AM 10/13/2015

As President Barack Obama pushed his green energy proposals for the auto-industry in 2011, Volkswagen was lobbying the administration for tax credits on its now tainted line of diesel vehicles.

Volkswagen wanted a green tax credit that applies to electric cars to be given to their diesel line as well. The Environmental Protection Agency, however, refused to go along with Volkswagen's plan and also declined Toyota's request to apply the same tax credit to their hybrid electric cars.

EPA documents from 2009 and 2010 show that Volkswagen supported the Obama administration's plan to reduce carbon dioxide emissions from automobiles. Former VW CEO Stefan Jacoby wrote to the EPA in 2010 praising their "leadership on this important subject." Jacoby, along with the EPA and other auto-makers, said they would "aim to make substantial annual progress in reducing transportation sector greenhouse gas emissions and fossil fuel consumption consistent with the Obama Administration's energy and climate security goals."

While Volkswagen was publicly backing White House efforts to tackle global warming and push green vehicles, the automaker was quietly lobbying behind the scenes to get government subsidies — the political price for the company's support of Obama's agenda. But the EPA refused to play ball, and Volkswagen withdrew its support for Obama's green vehicle push, according to The New York Times.

Margo Oge, the former director of the EPA Office of Transportation and Air Quality who worked closely with auto-makers on these proposals, told The New York Times that Volkswagen "wanted a special deal for diesel cars that we now know weren't even meeting the standard." Oge suggested that Volkswagen thought their diesel technology was superior to electric or hybrid alternatives, saying, "These people had religion, and that religion was diesel."

When Obama announced his plan to reduce carbon dioxide emissions from cars, Volkswagen was one of the only major automakers to not sign a letter of support for the president's agenda. The New York Times reports that much of this attitude came from overseas.

"My sense was that things were being dictated by Germany," said Oge.

Without a tax credit or subsidy, Volkswagen was going to have a tougher time meeting regulatory standards on emissions while still being able to advertise their diesel vehicles' good fuel economy and relatively low price. These reasons might have played a role in Volkswagen using "defeat devices" to get around EPA emissions tests.

Despite Volkswagen's efforts to get government assistance for their diesel line, their lobbying footprint in America remains relatively small, which could hurt them as this scandal moves forward. Volkswagen spent just $1.2 million on lobbying in 2014, a number dwarfed by General Motors which spends an average of $8.5 million a year on lobbying.

GM just recently settled with the government over the fact that they knowingly hid information about a faulty ignition switch that was linked directly to the deaths of 174 people. They were fined only $900 million and no one at GM was ever charged. Volkswagen currently faces up to $18 billion in potential fines.

All,

WSJ is working on a story about the AECD. They have two more follow-up questions. Ex. 5, 7

Ex. 5, 7

Who from Volkswagen alerted CARB and EPA to the additional AECD on Sept. 29? If in a letter, to whom was the letter addressed and may we see a copy?

What was EPA's response to Volkswagen between Sept. 29 and Oct. 7? We'd appreciate any detail.

Office: (202) 564-6287

Cell: (202) 412-2655

Liz/Nick:

Amy and I wanted to follow up on some questions we're hoping you can help with as we do reporting on VW.

1) Can you break down for us which of the VW diesel models are Generation 1, Generation 2 and Generation 3? Some detail beyond model years would be helpful, as I understand, for instance, that certain model-year Passats are Generation 2 but not Jettas. If you can tell us make, model and year for each generation, and tell us what differentiates each generation, that would be very helpful.

2) Could you walk us through or point us to the specific rules that require Volkswagen to explain the capabilities of auxiliary emissions control devices on the 2016 diesel models as part of the certification process? I understand they are obligated under EPA regulations to lay that all our for the agency. Perhaps you can point us to the specific rules or put us on the phone with someone who can help?

3) Has VW yet fulfilled its obligation to explain all the capabilities of the AECD on the 2016 diesel models? If not, has VW indicated when you can expect the full explanation?

Best,

Mike

API chief, bullish on Senate crude export vote, deflects on clean energy credits

By Kevin Rogers

The leader of the American Petroleum Institute on Wednesday said he sees "momentum" building in the Senate on a bill to lift the 40-year-old ban on crude oil exports, but he wouldn't say if his group would support extending clean energy tax credits if that's what it took to get the bill enacted.

On a call with reporters, API President and CEO Jack Gerard repeatedly declined to

comment on the floated compromise that would link crude exports to long-term extensions for wind and solar tax credits. Gerard said he believed there were "20 or 30 different paths" forward for export language, and said he didn't want to speculate on what form a final bill would take.

"The oil and natural gas industry has really left it to the Congress to decide how they develop the energy policies, who they give tax credits to, who they subsidize, who they don't," he told reporters on a call. "If something like that comes together, we'll be quick to share our views on it, but until we see something like that, it's premature to even comment on it."

Sen. Heidi Heitkamp, D-N.D., a leader of the Senate push to lift the ban, has said that renewable energy tax credits would be on the table to win Democratic support for the measure. Some members of the caucus, including Sens. Jon Tester, D-Mont., Martin Heinrich, D-N.M., and Angus King, I-Maine, have indicated they could support that approach.

The Solar Energy Industries Association, which is pressing for extension of its Investment Tax Credit -- which is set to begin phasing out next year -- said it would accept any congressional vehicle to reach that goal.

"Recently, there has been a lot of discussion on Capitol Hill about combining the lifting of the current ban on crude oil exports with long-term extensions of renewable energy tax credits, like the Investment Tax Credit," Vice President of Federal Affairs Christopher Mansour said in a statement. "SEIA strongly supports a long-term extension of the Investment Tax Credit, as a means of maintaining the phenomenal growth in American solar jobs, installations and investments. How Congress decides to make that happen is up to the congressional leadership."

But Jay Hauck, executive director of Consumers and Refiners United for Domestic Energy, which opposes lifting the ban, predicted that approach would backfire.

"Export proponents are stuck between a rock and a hard place," he said. "The more that they offer Democrats, the more likely they are to lose Republicans."

And some Senate Democrats believe the suggested deal won't materialize.

"The offer is not going to be put on the table," Sen. Ed Markey, D-Mass., said at an export forum last month. "The only reason it's teased out is that they want to figure out how they can put this thing together with the minimum number of Democratic votes in order to pass it."

Gerard said the most "efficient" path forward in the Senate would be a clean bill to end the ban. The Senate is currently sitting on such a bill, from Heitkamp and Sen. Lisa Murkowski, R-Alaska. A similar bill passed the House Friday by a vote of 261-159, with the backing of 26 Democrats.

Heitkamp and Murkowski's bill advanced in the Senate Banking Committee two weeks ago, though no Democrat other than Heitkamp voted for it. Any bill would require backing from at least six Democrats on the floor, as well as every Republican, to allow for a full debate and vote on the legislation.

Gerard was nonetheless optimistic that Congress could get a bill to President Barack Obama's desk by the end of the year.

"The process will finally determine that, but I think there's strong Democratic support for lifting the ban on crude oil exports," he said.

He also maintained that Obama could come to support such legislation, noting that the president has yet to go on the record against it.

"If you read the statement of administration position, it says that staff would recommend a veto, so I'm not sure the president has yet said — or I've not heard any senior leaders say — they would veto," he said.

Hauck dismissed Gerard's view as overly optimistic.

"The political calculus is a lot trickier in the Senate than in the House," he said. "We continue to believe that exports face an uphill battle in the Senate."

The White House veto recommendation, which was issued in connection with the House bill, argued that the Commerce Department already has necessary authority over exports. Proponents would need to gather 290 votes in the House and 67 votes in the Senate for an override.

Supreme Court seems troubled over demand response rule

By Sam Hananel

WASHINGTON (AP) — The Supreme Court on Wednesday seemed troubled by a federal regulation backed by environmental groups that requires utilities to pay big electric customers who save energy during times of peak demand.

The Obama administration and other supporters say the rule has helped consumers save billions in energy costs, improved reliability of the power grid and helped reduce air pollution since it was put in place in 2011.

But the key question during a one-hour argument that pitted the nation's current solicitor general against a past holder of the office was whether the Federal Energy Regulatory Commission overstepped its authority in adopting the program, known as demand response.

A federal appeals court ruled 2-1 last year that it intrudes on state power over retail electricity purchases. Federal law gives the commission authority to regulate wholesale markets, while retail sales are governed by states.

The issue appeared to divide the justices along political lines, with conservatives wary the commission had gone too far and liberals more willing to side with the government.

Fed says impact of lower oil prices reflected in latest snapshot

By The Associated Press

Steep drops in oil and gas prices in the past year continued to weigh on many energy producers, which are still cutting jobs in Texas, the Dallas Federal Reserve said Wednesday as part of the Federal Reserve's latest snapshot of the economy.

Oil and gas drillers are ordering less steel pipe and other equipment, dragging down factory output, according to many districts reporting in the Fed's "beige book" report.

Manufacturers are also struggling because of the strong dollar, which has increased about 13 percent in value against a basket of other currencies in the past 12 months. That makes U.S. goods more expensive overseas and lowers the price of foreign goods in the United States, cutting into U.S. exports.

Oil official: Federal rules threaten North Dakota's output

By James MacPherson

BISMARCK, N.D. (AP) — Forget slumping crude prices — it's a "suite" of proposed regulations by the Obama administration that most threaten North Dakota's oil production, a top industry official said Wednesday.

"Jurisdictional overreach appears to be the norm in the federal agency rulemaking process," North Dakota Petroleum Council Vice President Kari Cutting told a state legislative committee on energy development.

North Dakota sweet crude was fetching about $38 a barrel Wednesday, which is about half of what it sold for a year ago. The number of drilling rigs has plummeted in North Dakota by nearly two-thirds to 66 due to low prices but production remains at near-record levels as drillers concentrate rigs in high-volume areas.

Cutting, whose group represents more than 550 companies working in the oil patch, said the industry has increased efficiencies to keep production steady at about 1.1 million barrels daily, second only to Texas. But the industry will have a tougher time adapting to what she calls a "jurisdictional grab" by the federal government.

Fed review boosts ocean gas plan; foes seek NY governor veto

By Wayne Parry

ATLANTIC CITY, N.J. (AP) — A company that wants to build an ocean terminal off the coast of New York and New Jersey to import liquefied natural gas said Wednesday that a federal review supports its claim the $600 million project is safe and economically necessary.

Roger Whelan, CEO of Liberty Natural Gas, told The Associated Press that the final environmental impact statement from the U.S. Coast Guard bolsters its contention that the project to import natural gas to the New York metropolitan region during peak demand times should go forward.

The environmental review was released Friday, and the plan can be vetoed by the governor of either state. The United States Maritime Administration will make a final decision following public hearings this fall.

Neither New Jersey Gov. Chris Christie nor New York Gov. Andrew Cuomo has expressed his intentions regarding the application for what would be called Port Ambrose. Christie has vetoed a previous iteration of the plan, but both governors declined to discuss the subject last week.

Opponents, including environmentalists, fishing groups, and some elected officials, say an ocean terminal is a potential terrorist target, would disrupt fishing and would harm the environment. They say it's not needed because America already has large supplies of domestically produced natural gas.

2016 VW diesels have new software affecting emissions tests

By Michael Biesecker and Tom Krisher

WASHINGTON (AP) — Volkswagen has disclosed to U.S. regulators that there is additional suspect software in its 2016 diesel models that would potentially help their exhaust systems run cleaner during government tests.

Volkswagen confirmed to The Associated Press that the "auxiliary emissions control device" at issue operates differently from the "defeat" device software included in the company's 2009 to 2015 models disclosed last month. That disclosure triggered the worldwide cheating

scandal engulfing the world's largest automaker.

The newly revealed software makes a pollution control catalyst heat up faster, improving performance of the device that separates smog-causing nitrogen oxide into harmless nitrogen and oxygen gases.

VW spokeswoman Jeannine Ginivan said the new issue with the 2016 diesel models, known as an auxiliary emissions control device, was first revealed last week to U.S. Environmental Protection Agency and California regulators.

"This has the function of a warmup strategy which is subject to approval by the agencies," Ginivan said. "The agencies are currently evaluating this and Volkswagen is submitting additional information."

Recently named head of VW North America will not take post

By David McHugh and Tom Krisher

FRANKFURT, Germany (AP) — The recently named head of Volkswagen's North American business has left the company before taking up his new job — adding disruption as the company faces a scandal over rigging the results of emissions testing of its diesel vehicles.

It means that one of the company's most experienced managers will not be coming to lead the company's response in the United States as it faces possible heavy fines from the Environmental Protection Agency.

Volkswagen's Skoda division made the announcement about its chairman, Winfried Vahland, in a news release on Wednesday.

The release said that Vahland will not be moving to take over his new position carrying overall responsibility for North America because of "differing views on the organization of the new group region." It said his decision to quit was not related to the scandal over the

diesel engines.

EPA-Bunker-CleanAirAct-21 October 2015_Final.pptx
ATT00003.htm

Dear Jim, Byron and Cle,
Please find your final slides.

I under that you do not need airport pick up. Please let me know if you plan to join the welcome dinner in the evening of Oct 20.

Best,
Hui

EPA Compliance Programs
EPA达标管理
Office of Transportation and Air Quality
Compliance Workshop
美国环保局交通与空气质量办公室
Cleophas Jackson, Director
Gasoline Engine Compliance Center
汽油发动机合规管理中心

VW FOIA, EPA 06/20/2017 2017-FFP_034019

Compliance Overview
达标管理概况

- EPA's Regulatory Programs help ensure cleaner air and result in health and welfare benefits for all of us
- EPA's Compliance Programs are designed to ensure we achieve the expected air quality benefits and to ensure that manufacturers can compete on a level playing field
- Broadly we ensure compliance two ways – Compliance Determination and Compliance Oversight

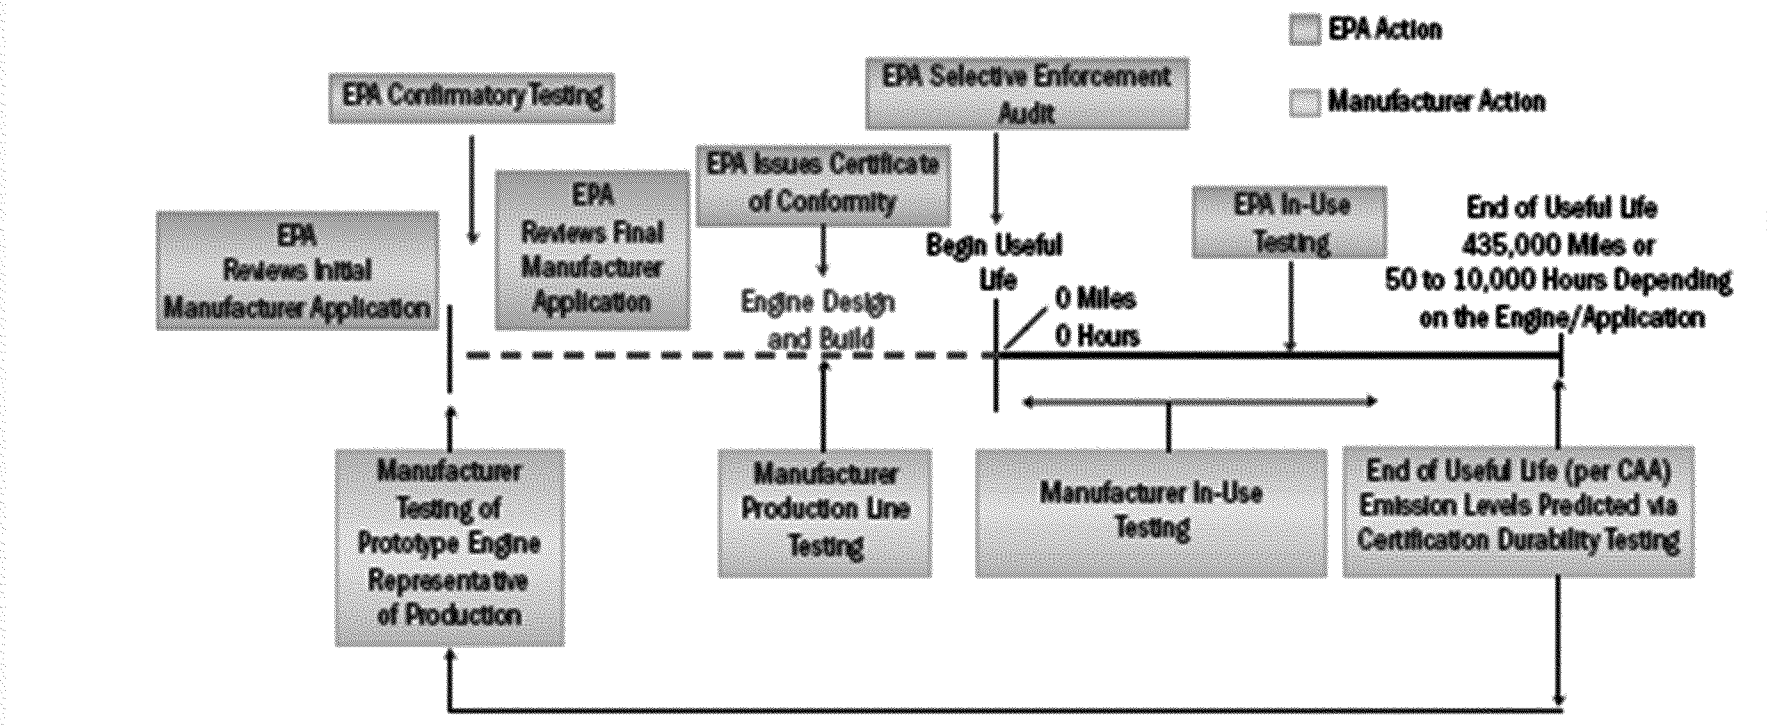
- EPA的管理方案帮助我们确保空气更加清洁，所有人都能从中获得健康和福利。
- EPA的达标管理从设计上就是为了确保我们能实现预期的空气质量收益并确保生产企业之间能够公平竞争。
- 大体上，我们通过两大途径来确保达标–达标判定和达标监管。

Compliance Overview
达标管理概况

- Compliance Review
  - Ramping up our certification review activity with more rigorous analysis of data submitted
    - If industry appropriately completes this work, we can have high confidence their product / process should be compliant.
    - We do not issue certificates (licenses to produce) if we do not believe manufacturers have met these requirements
  - Improving our oversight of manufacturer-submitted PLT reports
    - Leveraging information technology to identify potential problems from manufacturer-submitted compliance reports
    - Identifying potential manufacturing problems in real-time
  - Improving our cross-government communications (including with Customs) to turn away uncertified products at the port
  - Providing transparency for our compliance activities by posting those families that have faced actions such as voiding
    - http://www.epa.gov/otaq/motor-void.htm

- 达标管理概况
  - 对提交的数据进行严格分析，加强认证审核
    - 如果生产企业适当地完成了这些工作，我们会相信企业的产品/生产流程是达标的。
    - 如果生产企业没有满足这些要求，我们就不会为其发放认证证书（生产许可）。
  - 改善我们对生产企业的监管-提交生产线测试（PLT）报告
    - 通过生产企业提交的达标报告，借助信息技术来识别出可能存在的问题。
    - 实时发现生产企业可能存在的问题。
  - 加强政府机构之间的交流（包括海关），从港口清退未经认证的产品。
  - 公开提供达标管理行动的信息，公布面临处罚（比如吊销认证）的车辆系族
    - http://www.epa.gov/otaq/motor-void.htm

Compliance Life Cycle
车辆使用周期达标管理



Compliance Overview
达标管理概况

- Compliance Tools
  - Ramping up our confirmatory testing at EPA and Contract facilities
  - Auditing manufacturer's laboratories and engines/vehicles through Selective Enforcement Audits
  - Checking consumer products by purchasing equipment from retailers
    - Checking for accuracy of certification applications and performing emissions testing
  - Partnering with the California Air Resources Board, Environment Canada, and China's MEP to broaden our testing reach and to take coordinated recall/enforcement actions

- 达标管理手段
  - 加强EPA和合约检测机构的一致性测试工作
  - 通过选择性达标审核对生产企业的实验室和发动机/车辆进行审核
  - 从零售商处购买设备来检查终端消费产品
    - 检查配置是否符合认证规格并进行排放测试
  - 与加州空气资源委员会、加拿大环保部和中国环保部合作，拓宽我们的测试范围，并联合开展召回/执法行动。

Compliance Testing
达标管理测试

- EPA's program for engines includes a variety of types of emission testing outside of certification
  - Production Line Testing
    - Manufacturer verifies performance of production engines
  - Confirmatory Test
    - EPA audits emission performance of engine design
  - Selective Enforcement Audit
    - EPA audits emission performance of production engines
  - Laboratory Audit
    - EPA audits emission lab of manufacturer
  - In-Use Testing
    - EPA purchases new equipment and audits emission performance
    - Manufacturer run in-use programs with data submissions to EPA

- 除了进行认证测试，EPA对发动机的管理还包括多项不同的排放测试
  - 生产线测试
    - 生产企业审核发动机产品的性能
  - 一致性测试
    - EPA审核发动机设计排放性能
  - 选择性达标审核
    - EPA审核实际生产的发动机的排放性能
  - 实验室审核
    - EPA审核生产企业的排放实验室
  - 在用测试
    - EPA购买新生产设备并审核其排放性能
    - 生产企业进行在用测试并向EPA提交相关数据

Compliance Testing - PLT
达标管理测试-PLT

- Production Line Testing (PLT) –
  - Manufacturers perform low-hour emission tests on production engines
    - Maximum number of engines tested is 30 or 1% of production, whichever is lower
    - PLT does not apply to Small-volume manufacturers or approved small volume emission families
  - Statistical analysis determines if the family passes/fails
    - Manufacturers must notify EPA if an engine family fails its PLT
    - Engine certificate is suspended if family fails

- 生产线测试(PLT) –
  - 生产企业对发动机产品进行的排放测试
    - 发动机测试数量为最多30台或产品的1%，以二者较低者为准
    - PLT不适用于小批量生产企业或经过批准的小批量排放系族
  - 通过统计分析判定发动机系族是否通过测试
    - 如果发动机系族未能通过PLT测试，生产企业必须向EPA报告
    - 对于未能通过测试的系族，将暂时吊销发动机认证

Compliance Testing – PLT (cont.)
达标管理测试-PLT（续）

- Production Line Testing (PLT) –
  - Many families are subject to PLT testing each year
    - Remaining families are from exempted small-volume engine manufacturers and small-volume engine families, and engine families that had zero production
  - According to manufacturer submitted reports, no families have failed PLT testing
    - EPA has seen issues with some manufacturers and works to address those with the manufacturers
  - How to handle failing engines is the most common problem identified in EPA's review
    - Failing engines can be repaired and retested, but retest data should not be included in the PLT calculations
    - However, all retest data should be reported in PLT template

- 生产线测试(PLT) –
  - 很多系族每年都要进行PLT测试
    - 除了小批量发动机生产企业、小批量发动机系族和产量为零的发动机系族，其他发动机系族都要进行测试
  - 根据生产企业提交的报告，没有不通过PLT测试的系族
    - EPA已发现部分生产企业存在一些问题，并且会与生产企业共同解决这些问题
  - 如何处理未能通过测试的发动机是EPA在审核中最常遇到的问题
    - 未能通过测试的发动机可以在经过维修后重新进行测试，但复测数据不能被纳入PLT计算
    - 不过，所有复测数据必须在PLT模板中进行报告

Compliance Testing – Confirmatory Testing
达标管理测试－一致性测试

- Confirmatory Test
  - EPA issues test order to manufacturer
  - Manufacturer provides product to EPA for testing
  - EPA tests engine prior to certification approval

- 一致性测试
  - EPA向生产企业发出测试指令
  - 生产企业向EPA提供进行测试的产品
  - EPA在批准认证之前对发动机进行测试

Compliance Testing – Confirmatory Testing (cont.)

达标管理测试 – 一致性测试（续）

- Confirmatory Test
  - As we've tested more handheld engines, we've seen more testing/quality problems
    - We encourage all manufacturers to test their engines before shipping to EPA
    - Manufacturers will have 24 hours to repair/replace an engine that cannot run a valid test or fails the initial test
  - Certificate is not issued if engine family fails the confirmatory test

- 一致性测试
  - 随着我们对越来越多的手持发动机进行了测试，我们发现了更多的测试/质量问题
    - 我们鼓励生产企业在将发动机交给EPA之前先自己对发动机进行测试
    - 如果发动机无法进行有效测试或未能通过初测，生产企业将有24小时的时间对发动机进行维修/换件
  - 如果发动机系族未能通过一致性测试是无法获得认证的

Compliance Testing – Selective Enforcement Audit
达标管理测试–选择性达标审核

- Selective Enforcement Audit (SEA)
  - EPA issues test order to manufacturer
  - Manufacturer tests production engines
    - EPA may be present for engine selection and testing
    - Emission tests run at US-based facility listed in certification application
  - Number of engines passing/failing determines if a family passes or not
  - Engine certificate is suspended if family fails the SEA

- 选择性达标审核(SEA)
  - EPA向生产企业发出测试指令
  - 生产企业对发动机产品进行测试
    - EPA可能会到场参与发动机选择和测试
    - 由认证申请列表上列出的美国检测机构来进行发动机测试
  - 通过/不通过测试的发动机数量决定发动机系族是否最终通过
  - 如果发动机系族未能通过SEA审核，将暂时吊销发动机的认证

Compliance Testing – Audit
达标管理测试 – 审核

- Laboratory Audit -
  - EPA visits manufacturer test labs to perform and emission audit
    - Check records
  - Engine testing may be requested as part of audit
    - Check emission calculations
  - EPA continues as an active audit program of manufacturers' facilities, records, and emission performance
    - There are on-going reviews based on information gleaned from the audits

- 实验室审核 –
  - EPA检查生产企业的测试实验室并进行排放审核
    - 检查记录
  - 可以要求将发动机测试作为审核的一部分
    - 检查排放计算结果
  - EPA会持续性的对生产企业的设备、记录和产品排放性能进行审核
    - 也会不断审阅审核过程中获取的信息

Compliance Testing - In-Use Program
达标管理测试-在用车管理方案

- Goal:
  - Ensure in-use vehicles comply with standards
- Numerous data sources:
  - Defect reports, warranty, voluntary recall reports, IUVP data
- Testing
  - Manufacturer IUVP & IUCP
  - EPA in-use surveillance
- Enforcement tools
  - Voluntary recall
  - Mandatory recall
  - Service bulletins

- 目标:
  - 确保在用车符合标准要求
- 多方面的数据来源：
  - 缺陷报告、保修、自愿性召回报告、IUVP数据
- 测试
  - 生产企业IUVP & IUCP
  - EPA的在用车监管
- 执行手段
  - 自愿性召回
  - 强制性召回
  - 服务公告

Compliance Testing – In-Use Program (cont.)
达标管理测试-在用车管理方案（续）

- In-Use Testing -
  - EPA decides which families to test
    - EPA purchases products at retail establishments
  - Number of engines passing/failing would factor into EPA's decision whether to pursue further action
    - Clean Air Act criteria: Do a "statistically significant number" fail to meet the standards?
  - Engine certificate could be suspended if family fails
  - EPA has run pilot in-use programs for some sectors and manufacturer run in-use programs for other sectors
  - EPA plans additional work in this area in the future

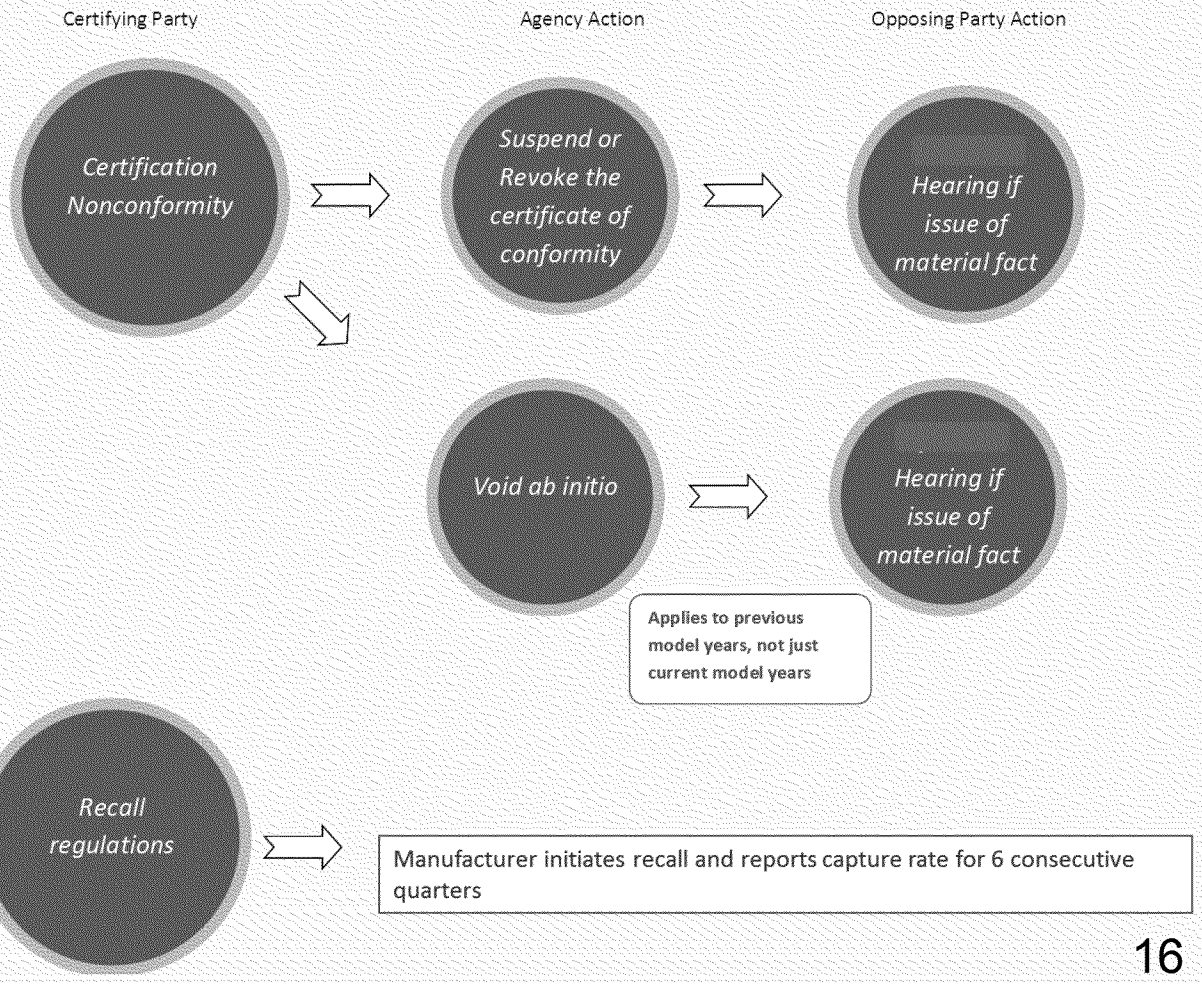
- 在用车测试 –
  - EPA决定对哪些系族进行测试
    - EPA在零售店购买产品
  - EPA会根据发动机通过/不通过的数量决定是否采取进一步行动
    - 清洁空气法中的标准：是否有相当数量的车辆/发动机未能满足标准要求？
  - 如果发动机系族未能通过测试，将暂时吊销发动机的认证
  - EPA在部分领域率先开展了在用车管理方案，生产企业负责开展其他领域的在用车管理方案
  - EPA计划在今后继续加强这方面的工作

In-Use Compliance
在用车达标管理

- Light Duty
  - IUVP (In-Use Verification Program)
  - EPA In-Use Testing
- Diesel Engines
  - Manufacturer In-Use Testing Program
  - EPA In-Use Testing (PEMS and Engine Dynamometer)
- Gasoline Engines
  - Manufacturer Run In-Use Programs
  - EPA In-Use Engine Testing (PEMS and Engine Dynamometer)

- 轻型车
  - IUVP（在用车审核方案）
  - EPA在用车测试
- 柴油发动机
  - 生产企业执行的在用车测试
  - EPA执行的在用车测试（PEMS和发动机测功机）
- 汽油发动机
  - 生产企业执行的在用车管理
  - EPA执行的在用发动机测试（PEMS和发动机测功机）

What happens when noncompliance is identified?
发现不达标情况后怎么处理？



Coordination with Partner Agencies
与其他部门合作

- CARB
  - EPA coordinates with ARB on a regular basis to help provide a broad compliance presence
  - EPA also seeks to reduce unnecessary burden to avoid duplication of redundant testing activities
- Canada
  - EPA engages in compliance coordination with Environment Canada
  - Within the scope of the President's Regulatory Cooperation Council and the existing U.S. / Canada Air Quality Agreement the two agencies collaborate on regulatory initiatives to improve efficiencies within the North American market
- China
  - EPA has initiated outreach and coordination efforts with the Ministry of Environmental Protection (MEP) to facilitate opportunities for information exchange with MEP staff
  - EPA is also working to establish compliance engagement to address product compliance prior to arrival at U.S. ports

- CARB
  - EPA与ARB进行常规合作，加强达标管理
  - EPA正在努力减少不必要的负担，避免重复测试的行为
- 加拿大
  - EPA与加拿大环境部开展达标管理协作
  - 在美加联合管理和美加空气质量协议的范围内，两家管理机构将开展管理合作，提高北美市场的效率。
- 中国
  - EPA已经开始拓展与中国环境保护部之间的合作，为环保部的官员提供信息交换的契机。
  - EPA还着力于签署达标合约的工作，在产品到达美国口岸之前加强对产品的达标管理。

Conclusion
结论

- EPA regulatory programs help ensure cleaner air and result in significant health and welfare improvements
- EPA Compliance Programs are designed to help ensure we achieve these air quality benefits and to help ensure that manufacturers investing to comply with these programs can compete on a level playing field
- EPA staff is ready to answer your questions and work with you to ensure the products you make help achieve these goals

- EPA的管理方案帮助我们确保空气更加清洁并获得显著的健康和福利。
- EPA的达标管理从设计上就是为了确保我们能实现这些空气质量收益并确保为遵守管理要求的生产企业提供公平竞争的平台。
- EPA工作人员会时刻回答你的问题并与你一起共同工作，确保所生产的产品实现上述目标。

U.S. Clean Diesel Legacy Fleet Program
美国在用柴油车清洁管理方案

The 5th Sino-US Mobile Source Emission Control Workshop

第五届中美机动车排放达标监管研讨会

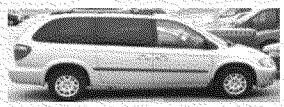
Multiple Drivers for Reducing Diesel Emissions
多方面原因要求降低柴油车排放

- Diesels were responsible for 90% of the U.S. mobile emissions of particulate matter (2005 inventory)
- Studies link breathing diesel PM to significant health problems:
  - –aggravated asthma and decreased lung function
  - –Cancer
  - –Heart disease
- Diesel emissions often affect sensitive subpopulations and disadvantaged communities the most
  - –Children are especially vulnerable
    - Rate of respiration is faster than adults
    - Pollutants are 2-5 times more concentrated inside school buses than outside
- Proven, cost-effective technologies and strategies exist to effectively address the problem

- 柴油车（发动机）占美国移动源颗粒物排放的90%（2005年清单）
- 研究表明，柴油车PM会导致严重的健康问题：
  - 加重哮喘和降低肺部功能
  - 癌症
  - 心脏病
- 柴油车排放对敏感和弱势人群的影响最为严重
  - 儿童尤其容易受到伤害
    - 呼吸频率比成年人快
    - 校车内的污染物浓度是外面的2-5倍
- 经证明，现有的技术和管理措施已经能够在费效比合理的前提下有效解决柴油车排放问题。

EPA's National Clean Diesel Campaign - Regulatory Roadmap
EPA的国家清洁柴油车行动-管理蓝图

Light-Duty 轻型车

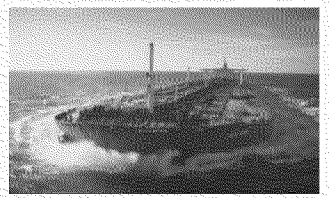


final rule 1999 1999年出台最终管理规定
fully phased in 2009 到2009年全面实施
Diesels held to same stringent standards as gasoline vehicles 汽柴油车辆执行同样严格的排放标准

Heavy-Duty Highway 道路重型车
sales 800,000 / yr 年销量89万辆
40B gallons / yr 年耗油量400亿加仑
final rule 2000 2000年出台最终管理规定
fully phased in 2010 到2010年全面实施

Nonroad Diesel 非道路柴油机械
sales over 650,000 / yr 年销量超过65万台
12B gallons / yr 年耗油量120亿加仑
final rule 2004 2004年出台最终管理规定
fully phased in 2015 到2015年全面实施

Locomotive/Marine 火车/船舶
sales 40,000 marine engines 年销量船舶发动机4万台
1,000 locomotives / yr 火车机车1000辆
6B gallons / yr 年耗油量60亿加仑
final rule 2008 2008年出台最终管理规定
fully phased in 2017 到2017年全面实施



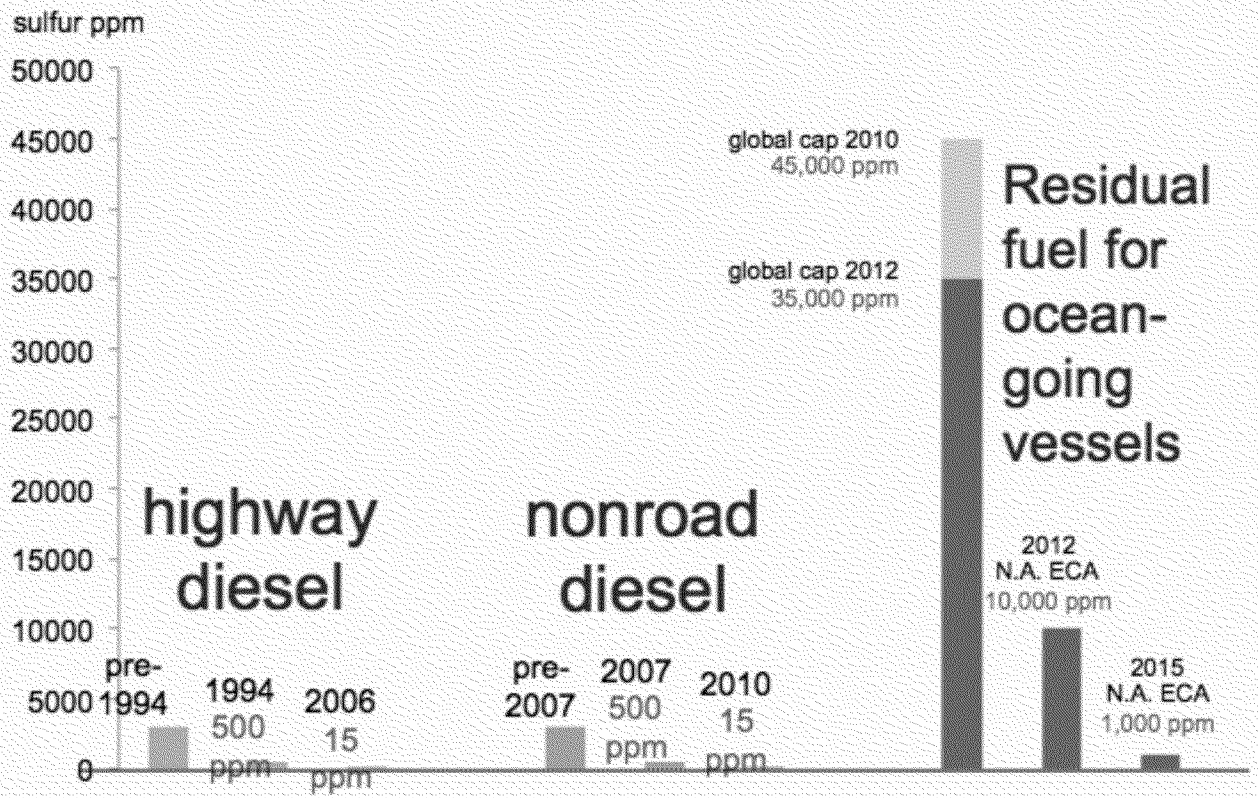
Ocean Going Vessels 远洋船舶
CAA Rule Dec 2009 2009年12月CAA管理规定
IMO MARPOL Annex VI IMO MARPOL 附录VI
ECA Controls ECA控制
- Fuel Based 2015 2015燃料基准
- SCR Catalyst Based 2016 2016 SCR催化器基准

Note: 销售量和柴油燃料消耗量每年都是不同的，图片信息仅供参考比较用途。

Common Aspects *管理共性--*

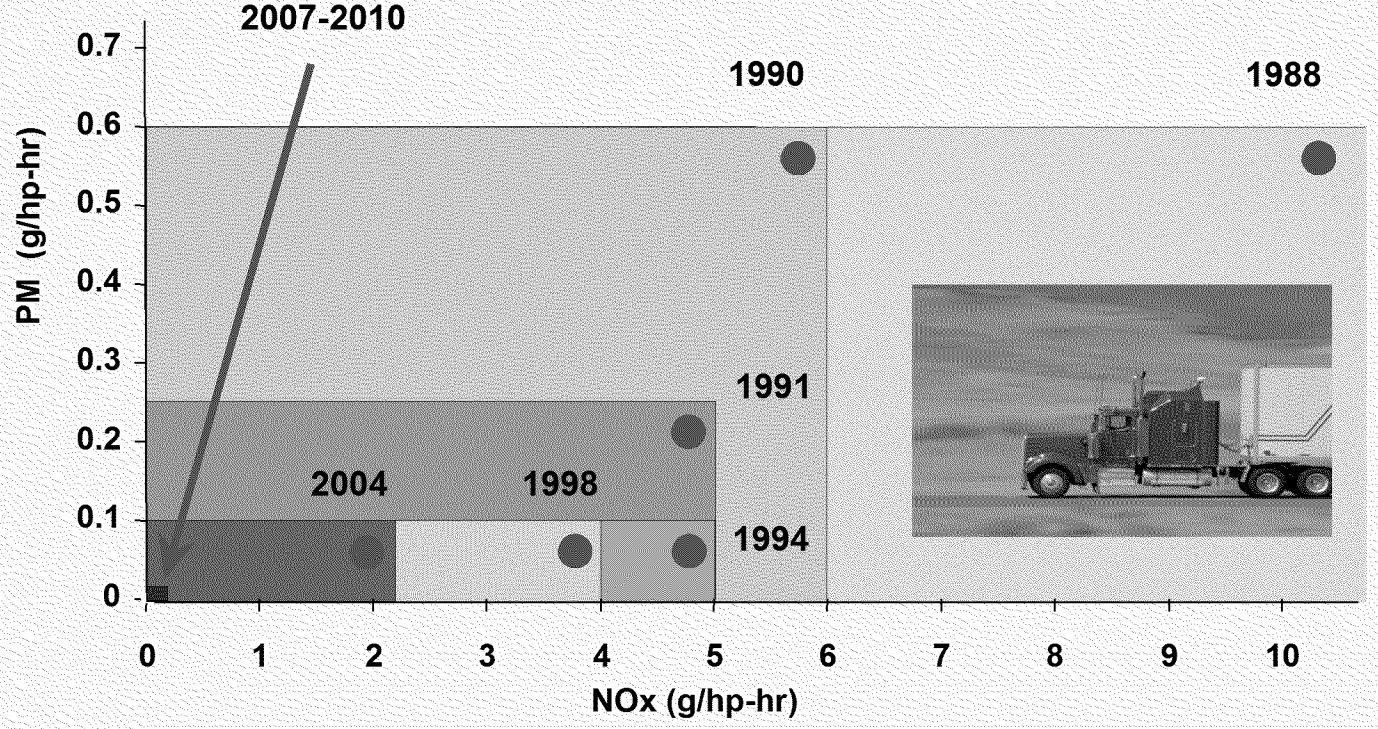
- Systems approach– ULSD enables clean technologies. 系统化模式—超低硫柴油燃料使得清洁技术得以应用
- Large environmental and public health benefits
  获得环境和健康方面的大幅收益
- Current regulations: by 2030, PM reduced by ~250,000 tons/year, NOx by ~4 million tons/year. Annual benefits are expected to exceed $175 billion versus costs of approximately $11 billion. 现有管理：到2030年，PM减排约25万吨/年、NOx减排约400万吨/年。年收益预计可达1750亿美元，成本仅约为110亿美元。
- Responsive to needs of states to meet NAAQS
  均为满足国家环境空气质量标准
- Collaborative process 需要协作完成

Clean Diesel Fuel Enabled Clean Diesel Engines
清洁柴油燃料为清洁柴油发动机奠定基础



Increasingly Stringent Technology-Forcing Standards for Trucks and Buses

不断加严卡车和巴士的标准，推进技术应用



Existing Diesel Engines & Emissions
现有柴油发动机&排放

- Standards for new engines, no matter how tight, cannot clean up the existing fleet
- Reducing emissions from diesel engines remains one of the most important air quality challenges facing the country
- Even with more stringent standards set to take effect in the next decade, over the next 20 years, millions of existing engines will continue to emit large amounts of pollution
- This pollution will continue to contribute to numerous instances of premature mortality, asthma attacks, lost work days and many other health impacts

- 无论新发动机的标准有多么严格，都无法减少现有在用车辆的排放。
- 减少柴油发动机排放仍然是国家面临的最主要的空气质量挑战之一。
- 即使今后10年实施了更为严格的标准，20年后，仍然有上百万的老旧发动机继续维持较高的污染物排放。
- 这些污染物会继续导致大量的提早死亡、哮喘发作、误工和其他健康影响。

VW FOIA, EPA 06/20/2017 2017-FFP_034043

Legislative Support for the National Clean Diesel Campaign
为国家清洁柴油车行动提供法律支持

- Congress passed The Diesel Emissions Reductions Act (DERA), which was originally part of the Energy Policy Act of 2005.
- This law provided funding for grants and low-cost revolving loans to reduce diesel emissions from the “legacy fleet” of existing engines.
  - Authorized up to $200m annually (2007 to 2011)
- Reauthorized in 2010
  - Authorized up to $100m annually (2012 to 2016)
  - Added authority to provide rebates to individual vehicle owners

- 国会通过了柴油车减排法案（DERA），该法案原本是2005能源政策法的一部分。
- 该法案为降低在用柴油发动机排放提供低息贷款。
  - 每年最高可批准2亿美元(2007 -2011)。
- 2010年再次获得授权
  - 每年贷款额度最高1亿美元（2012-2016）。
  - 添加了可以向私人车主提供现金补贴的授权。

VW FOIA, EPA 06/20/2017 2017-FFP_034044

The U.S. Experience: Focus on Key Sectors
美国的经验：把重点放在关键领域

- We target our efforts based on:
  - Levels of emissions
  - Public health impacts
    - Non-attainment zones
    - Proximity to sensitive populations
  - Cost-effectiveness of reduction strategies
  - Timely opportunities
    - e.g. Expansion of ports and major road construction
  - Support from stakeholders and the public

- 我们基于以下几点确定管理重点：
  - 排放水平
  - 对公众健康的影响
    - 不达标地区
    - 与敏感人群的接近程度
  - 减排措施的成本效益
  - 时间契机
    - 例如：港口扩建和主干道建设
  - 相关部门和公众的支持

VW FOIA, EPA 06/20/2017 2017-FFP_034045

Diesel "Retrofit" Solutions
柴油车"改造"解决方案

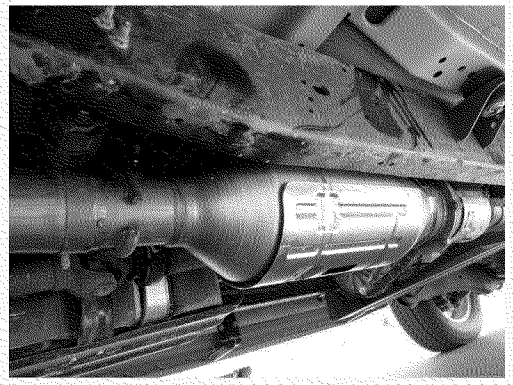
Retrofit Technologies can be:

改造技术可以：

any change to an engine system above and beyond that required by EPA regulations that improves the engine's emission performance:

对符合或未达到EPA管理要求的发动机系统进行任何改造，从而改善发动机的排放性能：

- Catalyst or filter 催化器或过滤器
- Early engine or vehicle replacement 老旧发动机或车辆置换
- Other devices or systems like SCR, CCV 其他装置或系统，如SCR、CCV
- Engine upgrade (generally at rebuild) 发动机升级（基本上是更换）
- Cleaner fuels 更清洁的燃料
- Idling reduction 减少怠速
- Combination of above 结合应用上述技术手段



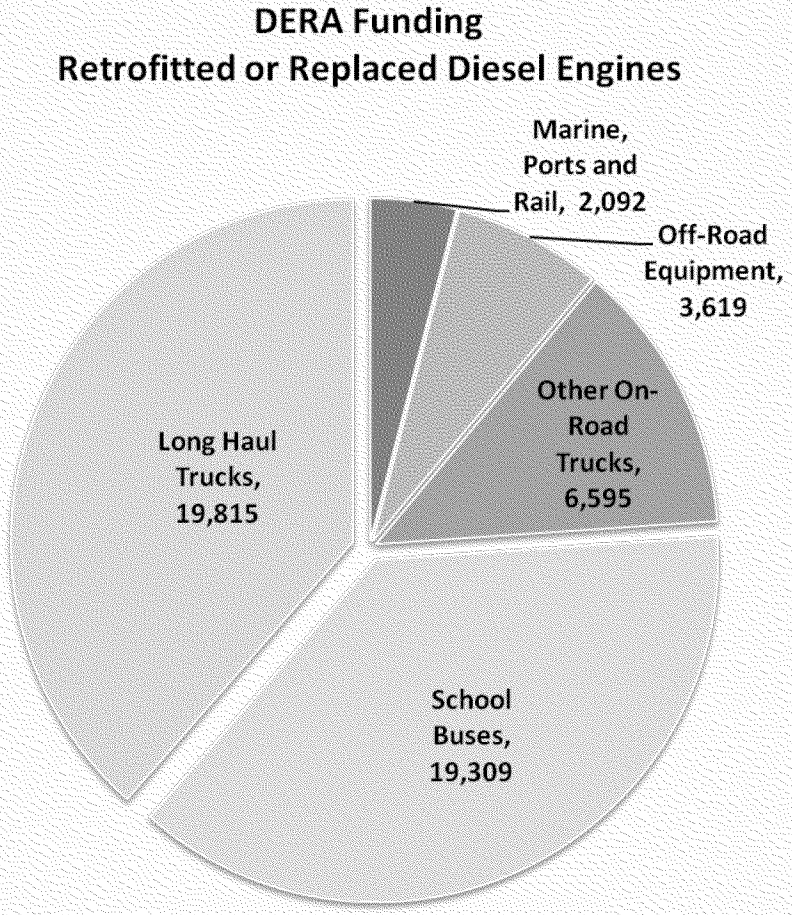
Key Elements of the National Clean Diesel Campaign
国家清洁柴油车行动的关键要素

- Technology Verification
- Competitive Request for Proposals
- Rigorous project review and selection
- Onsite visits, monitoring activities
- Training for Regional EPA staff and Grantees
  - Webinars
  - Technical information
  - Trouble shooting
- Implemented reporting requirements
- Partnerships, Collaboratives and Stakeholder Support

- 技术审核
- 要求出台具备竞争力的方案计划
- 严格的项目审核和选择
- 现场调查和监管行动
- 对地方EPA工作人员和使用者进行培训
  - 网络会议
  - 技术信息
  - 问题答疑
- 实施报告管理要求
- 获得合作伙伴、协作方和相关部门的支持

VW FOIA, EPA 06/20/2017 2017-FFP_034047

Results of EPA's National Clean Diesel Campaign
EPA国家清洁柴油机行动的成果



- ❖Over $500 Million funded approximately 420 projects
- ❖花费超过5亿美元资助约420个项目
- ❖Over **50,000 vehicles and equipment** retrofitted, replaced or repowered
- ❖对5万台以上的车辆和机械设备进行了改造、置换或翻新
- ❖For every dollar invested in reducing diesel exhaust, a community may achieve up to $13 in public health benefits
- ❖每花1美元投资柴油车尾气减排，可获得高达13美元的公众健康收益
- ❖For every dollar invested in the program, as many as three dollars are invested by other government agencies, private organizations, industry and non-profit organizations
- ❖每向项目中投入1美元，其他政府部门、私人机构、工业企业和NGO就会投入多达3美元

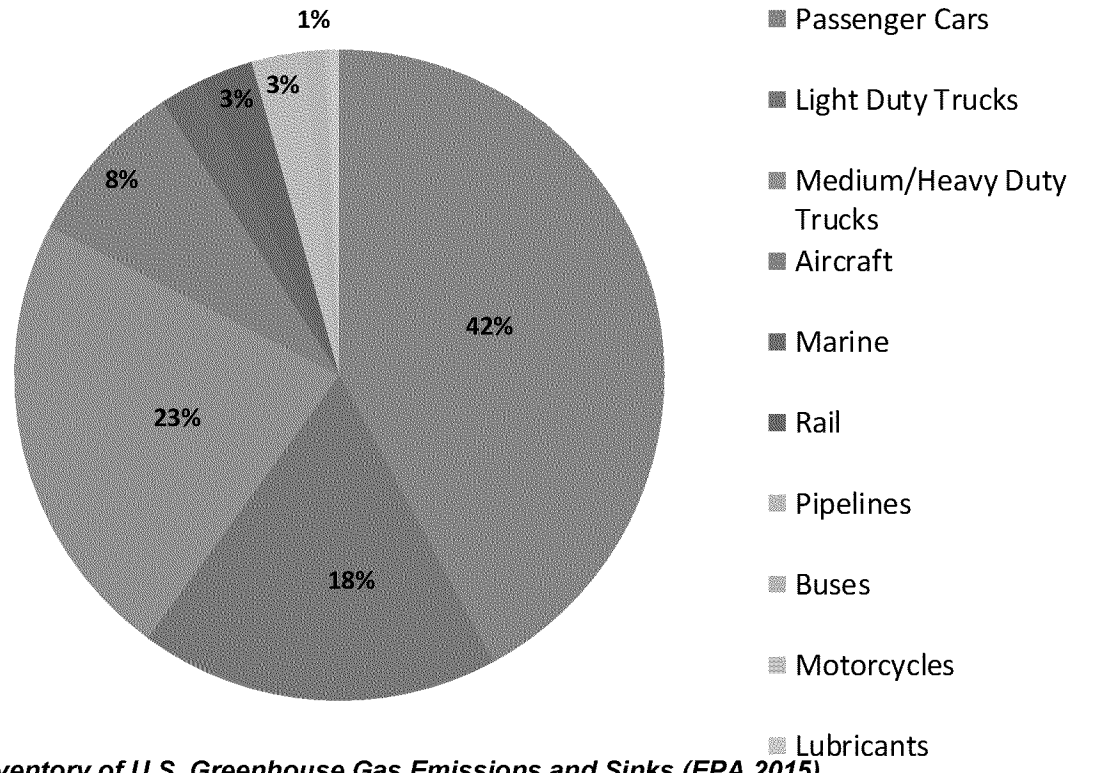
SmartWay®

SmartWay Drivers:
Freight Sector Environmental Impacts
开展SmartWay的原因：货运部门的环境影响

Transportation in U.S.:
美国的交通部门
- Over 1/4 total GHG emissions
- 占温室气体总排放的1/4
- About 2/3 petroleum-based fuel use
- 占石化燃料使用量的2/3

In Transport Sector:
在交通部门中：
- Freight accounts for over 25% of all fuel consumed and GHGs emitted
- 货运部门占油耗和温室气体排放总量的25%以上
- Freight is fastest growing source of transport GHGs
- 货运部门是增长速度最快的交通温室气体排放源



2013 Data - Inventory of U.S. Greenhouse Gas Emissions and Sinks (EPA 2015)

SmartWay Drivers: Economic Impacts of Freight
开展SmartWay的原因：货运部门的经济影响

- **Freight transportation is cornerstone of U.S. economy**
  - Trucking & rail deliver goods and materials that drive economic growth and development
  - Domestic commodity and consumer goods shipments
  - Exports and Imports
  - Freight system moves:
    - 20 billion tons of freight per year
    - 63 tons of freight per person each year
    - $17 trillion worth of freight yearly
    - $47 billion worth of freight daily
    - 54 million tons of freight daily
- **Transportation logistics costs $836 billion** (5.4% of GDP)

- **货运交通是美国经济的基石**
  - 卡车和铁路运输货品和原料带来了经济增长和发展
  - 国内日用品和消费产品运输
  - 出口和进口
  - 货运系统运输量：
    - 每年200亿吨货运量
    - 每人每年63吨货运量
    - 每年运输货物价值17万亿美元
    - 每天运输货物价值470亿美元
    - 每天运输货物5400万吨
- **交通物流成本为8360亿美元（占GDP5.4%）**

US DOT Transportation Statistics Annual Report, 2013
CSCMP Annual State of Logistics, 2013

VW FOIA, EPA 06/20/2017 2017-FFP_034051

SmartWay Snapshot Today
SmartWay发展现状

- Since 2004, SmartWay has grown to about 3,000 partners with broad freight industry support
  - Top 100 U.S. truck carriers and Major logistics firms
  - All Class 1 rail lines
  - Fortune 500 shippers from every major business sector
- Since 2004, SmartWay Partners saved:
  - 61.7 million metric tons of CO_2
  - 1,070,000 tons NOx and 43,000 tons PM
  - 144.3 million barrels of oil and 6.1 billion gallons of fuel
  - $20.6 billion dollars in fuel costs
- *Equivalent to taking over 13 million cars off the road for 1 year*

- 自2004年起，SmartWay迄今已经发展了约3000个合作伙伴，获得货运行业的广泛支持。
  - 美国前100名卡车运营商和主要物流公司
  - 所有级别1铁路线
  - 来自所有主要商业领域的财富500公司
- 自2004年以来，SmartWay伙伴单位共计实现：
  - 减排CO_2 6170万公吨
  - 减排NOx107万吨，PM4.3万吨
  - 节约1.443亿桶原油和61亿加仑燃油
  - 节约燃油成本$206亿美元
- *相当于避免1300万辆轿车上路行驶1年*

SmartWay Serving as Global Role Model
SmartWay成为全球版本

- In 2012, NRCan adopted SmartWay into Canada
  - Joint US/Canada SmartWay program
- Mexico implemented a green freight program, *Transporte Limpio* ("Clean Transportation") modeled after SmartWay
- Green Freight Europe and Green Freight Asia modeled on SmartWay
- Climate and Clean Air Coalition selected "Green Freight" as key transportation project to reduce climate emissions
  - Global Green Freight Action Plan includes SmartWay methods
  - Green Freight initiative to be modeled after SmartWay
    - EPA produced training curriculum to implement green freight programs
  - Other approaches are low sulfur fuel and cleaner vehicles

- 2012年，NRCan将SmartWay引入加拿大
  - 美加联合SmartWay管理方案
- 墨西哥根据SmartWay实施了清洁交通绿色货运方案
- 欧洲绿色货运行动和亚洲绿色货运行动也是以SmartWay为原型
- 气候与清洁空气联盟（CCAC）选择将“绿色货运”作为减少交通领域气候影响排放的重点项目
  - 全球绿色货运行动计划就包括了SmartWay的模式
  - 绿色货运行动是仿照SmartWay的
    - EPA制作了实施绿色货运方案的培训教程
  - 其他手段则是低硫燃料和更清洁的车辆

SmartWay Collaboration in China
SmartWay在中国的合作

City - Guangzhou Green Truck Pilot 2009-2010

城市-广州绿色卡车试点2009-2010

- Joint collaboration with World Bank, CAI-Asia and EPA OTAQ
- 世界银行、CAI-Asia和EPA交通与空气质量办公室共同协作
- Retrofit six trucks from three companies with SmartWay technologies
- 利用SmartWay技术对3家公司的6辆卡车进行了改造
- Developed driver training program for fuel efficiency
- 对驾驶员进行了燃油能效方面的培训
- Demonstrated 2% - 18% fuel savings
- 证明可节油2%-18%

Province - Green Truck Demonstration Project 2010 – 2015

省级-绿色卡车试点项目2010-2015

- World Bank and Global Environmental Facility (GEF) grant funding to leverage commercial bank lending
- 世界银行和全球环境基金（GEF）提供资助调节商业银行贷款
- Goal – retrofit 1,200 trucks in Guangdong with fuel saving technologies
- 目标-对广东省的1200辆卡车进行节油技术改造
  - Components include driver training, improved logistics, capacity building
  - 重点包括驾驶员培训、改善物流和能力建设
  - US Green Freight study tour, June 2010 for PMO officials' capacity building to learn SmartWay best practices, program development, program tools, etc.
  - 2010年6月，组织PMO官员进行美国绿色货运学习，主要学习SmartWay的经验、管理方案制定和管理实施工具等
  - PMO hosted a workshop and green technology trade fair, November 2011
  - 2011年11月PMO举行了关于绿色技术贸易的研讨会

VW FOIA, EPA 06/20/2017 2017-FFP_034054

SmartWay Collaboration in China
SmartWay在中国的合作

National - Green Freight China Initiative 2011 -

国家-中国绿色货运行动 2011-

- Program design builds upon Guangdong projects and SmartWay
- 方案设计是基于广东省的项目和SmartWay
- MOT, CRTA, CAA, Energy Foundation developed CGFI with key stakeholders
- 交通部、世贸组织区域贸易协议委员会、亚洲清洁空气中心、能源基金会与其他主要相关机构一起制定了中国绿色货运行动方案
- Annual Green Freight Summits with broad stakeholder participation
- 每年相关组织会参加年度绿色货运峰会
- SmartWay program training to share best practices and lessons learned (July 2014)
- 开展SmartWay管理方案培训，分享和学习最佳实践经验（2014年7月）
- EPA supporting CGFI Shipper Day Nov 5, 2015
- EPA将为2015年11月5日的中国绿色货运日提供支持

EPA Authority Under the Clean Air Act
清洁空气法赋予美国环保局的权力
Regarding Motor Vehicle Emission and Fuel Standards
关于机动车排放和燃油标准

Byron Bunker
Director, Compliance Division
达标管理处 处长
Office of Transportation and Air Quality
交通与空气质量办公室

VW FOIA, EPA 06/20/2017 2017-FFP_034057

Clean Air Act (CAA)
清洁空气法(CAA)

- Can be found at 42 United States Code§7401
- Enacted in 1970 and amended in 1977 and 1990
- Comprehensive federal law that regulates air emissions from stationary and mobile sources
- Law authorizes EPA to establish National Ambient Air Quality Standards (NAAQS) to protect public health and public welfare and to regulate emissions of hazardous air pollutants

- 可查阅美国法律§7401。
- 1970年颁布，1977年和1990年两次进行修订。
- 是管理固定源和移动源空气排放的综合性联邦法律。
- 法律授权美国环保局(EPA)制定国家空气质量标准(NAAQS)来保护公众健康和公共财产同时管理有害空气污染物排放。

VW FOIA, EPA 06/20/2017 2017-FFP_034058

CAA Section 202
CAA第202节

- Section 202 authorizes EPA to **set standards** and **prescribe regulations** for the emissions of any air pollutant from any **new motor vehicle or new motor vehicle engine**, which in the judgment of the Administrator, cause, or contribute to, air pollution which may endanger public health or welfare.

- Standards apply for the **useful life** of the vehicle or engine.

- **第202节授权EPA根据自己的判断，针对新生产机动车或车辆发动机排放出的任何可能危害公众健康或财产的空气污染物制定排放标准和管理规定。**
- **标准适用于车辆或发动机的整个使用寿命周期。**

VW FOIA, EPA 06/20/2017 2017-FFP_034059

CAA Section 206
CAA第206节

- Section 206 authorizes EPA to **establish test procedures and protocols** and **issue certificates of conformity** to manufacturers if they meet the standards established by EPA under Section 202.

- **第**206节**授**权EPA**制定**测试规**程和**标**准**，**并授**权EPA**向**满**足**EPA**在**202节**下所制定的**标**准的生**产企**业颁发**一致性**认证。

VW FOIA, EPA 06/20/2017 2017-FFP_034060

Regulatory Process
How EPA creates Standards & Test Procedures
管理流程
EPA是如何制定出标准和测试规程的

- Notice of Proposed Rule Making NPRM
  - Formal proposal by EPA that describes the need for regulation, the cost and benefits of regulation, and draft regulatory language.
  - Public processes with public hearings and open docket.
  - Issued under the EPA Administrator's authority from the CAA.
- Final Rule
  - Final decision by EPA including update analyses and public policy considerations from the proposed rule.
  - EPA must consider all relevant comments.
  - Rule becomes effective 60 days after published, unless challenged in court
  - Issued under the EPA Administrator's authority from the CAA.

- 发布即将出台新规的通知(NPRM)
  - 由EPA发布的正式建议书，说明管理需求、管理成本和收益并起草管理规定的内容。
  - 公开流程包括公开听证和公开记录
  - 根据CAA对EPA管理者的授权来发布管理草案
- 最终管理规定
  - 由EPA根据最新的分析结果和公众对管理草案的建议来做出最终的决定。
  - EPA必须考虑所有相关意见。
  - 管理规定将于发布后60日生效，除非遇到法律方面的阻碍。
  - 根据CAA对EPA管理者的授权来发布最终管理规定。

VW FOIA, EPA 06/20/2017 2017-FFP_034061

CAA Section 203
CAA第203节

- Section 203 enumerates specific prohibitions.
  - Prohibition against the sale or introduction into commerce of a new vehicle or engine unless covered by a Certificate of Conformity.
  - Prohibition against tampering – remove or render inoperative any device or element of design.
  - Prohibition against manufacture or sale of a defeat device.
  - Prohibition against failure to perform required tests, or provide required records.

- 第203节中列出了一些专门的禁止令。
  - 除非新生产车辆或发动机获得一致性认证，否则不得销售或进入市场。
  - 禁止作弊干扰-拆除任何装置或设计元件或使其无法使用。
  - 禁止生产或销售失效装置。
  - 必须依照规定进行测试并提供记录。

VW FOIA, EPA 06/20/2017 2017-FFP_034062

CAA Section 207
CAA第207节

- Section 207 authorizes EPA to require a manufacturer to **issue a recall** if a substantial number of any class or category of vehicles or engines do not conform to the regulations prescribed under Section 202 when in actual use

- **根据第**207节**的授**权，**如果**发现**有相当一部分某等**级**或某**类别**的**车辆**或**发动**机在**实际**使用过程中未能符合**202节**中的相关管理规定**，EPA**有权要求生产企业实施召回。**

VW FOIA, EPA 06/20/2017 2017-FFP_034063

CAA Section 205
CAA第205节

- Section 205 authorizes EPA to commence civil actions to assess and recover any **civil penalties for violations** of prohibited acts enumerated under Section 203, as well as 211(d), and 213(d)

- **根据**205节**的授**权，EPA**有**权对违**反**203节、211节(d)节(d)**段和**213节(d)**段中的禁令的行**为进**行民事行**为评**估并处**以民事**罚**款**。

VW FOIA, EPA 06/20/2017 2017-FFP_034064

CAA Section 211
CAA第211节

- Section 211 authorizes the EPA to **regulate any fuel or fuel additive** for use in a motor vehicle, motor vehicle engine, or nonroad engine or nonroad vehicle,
- Require registration of fuels and fuel additives prior to introduction into commerce.

- **第**211节**授**权EPA**管理机**动车、**机**动车发动**机、非道路**发动**机或非道路**车辆**使用的所有燃料或燃料添加**剂。
- **要求所有燃料和燃料添加**剂**在**进**入市**场**之前要**进**行登**记**注册。**

VW FOIA, EPA 06/20/2017 2017-FFP_034065

CAA Section 213
CAA第213节

- Section 213 authorizes EPA to **set standards** and **prescribe regulations** for the emissions from **new nonroad engines and new nonroad vehicles** (other than locomotives or engines used in locomotives)

- **第**213节**授**权EPA针对**新生**产**非道路**发动**机和新生**产**非道路**车辆**制定**标**准及管理**规**定**(**不包括火**车**机**车**或火**车**机**车**用**发动**机**)。

VW FOIA, EPA 06/20/2017 2017-FFP_034066

In Summary, CAA Authorizes EPA
CAA对EPA授权情况汇总

- Set standards for vehicles, engines and fuels that apply for the useful life of the product.
- Create test procedures and protocols to evaluate performance against the standards.
- Authority to issue certificates & register fuels prior to their introduction into commerce.
- Require recalls of vehicles and engines that do not comply in use.
- Prohibit noncompliance.
- Enforce for noncompliance.

- 制定车辆、发动机和燃料标准，且标准适用于产品的整个使用寿命周期。
- 开发测试规程和测试标准来评估达标情况。
- 在车辆和燃料产品进入市场前对其发放一致性认证和进行登记注册。
- 要求召回不达标的在用车辆和发动机。
- 禁止不达标行为。
- 针对不达标行为采取执法措施。

GRID:

Justices question regulators' reach in fight over energy rule

Robin Bravender, E&E reporter

Published: Wednesday, October 14, 2015

Supreme Court justices today probed whether federal regulators overstepped legal limits with a rule incentivizing energy conservation.

At issue is the scope of the Federal Energy Regulatory Commission's power in a case on a demand-response rule that required that power users be paid for committing to scale back electricity use at times of peak demand.

A lower court threw out the rule last year, agreeing with power generators and other challengers that FERC -- charged with regulating wholesale electricity sales -- had overstepped its authority by wading into the retail electricity market. Retail power sales to businesses and residential customers legally fall under states' jurisdiction.

Justice Anthony Kennedy said it's clear that the wholesale and retail markets affect each other but questioned where to draw the regulatory line. "The statute makes a distinction," he said. "We have to make a distinction."

Chief Justice John Roberts suggested too that a boundary is needed to prevent FERC from broadly expanding its regulatory reach.

"What is the limiting principle that you would suggest?" he asked.

Solicitor General Donald Verrilli, representing FERC, said he was comfortable with the court drawing a line but argued that in this case, the agency was acting well within its authority. All the conduct FERC is regulating "occurs in the wholesale market," he told the court.

Grid operators and power providers -- represented by the Electric Power Supply Association (EPSA), American Public Power Association and others -- led the charge to upend the rule, telling the courts that it sets an unfair compensation scheme and is illegal because it's beyond FERC's jurisdiction.

Justice Antonin Scalia questioned why FERC has the ability to allow states to opt out of the rule if they choose to do so. He asked whether that wasn't an acknowledgement that FERC was "mucking around" in states' business.

Paul Clement, an attorney representing FERC's challengers today, argued that FERC's order was "impermissibly" on the retail side of the line.

FERC's challengers had written in a brief to the court that the agency "cannot expand its own jurisdiction at the expense of the states' exclusive jurisdiction by asserting a need to regulate a 'direct effect' on wholesale rates that FERC has created by inviting retail customers into the wholesale market."

Verrilli argued there is no text explicitly barring FERC from issuing the rule and that the justices should therefore defer to the agency's authority.

At least one justice appeared to agree with that argument, noting he and his colleagues on the court are

not electricity regulators.

"Is what they're doing here unreasonable?" Justice Stephen Breyer asked.

The case has sparked the interest of a broad range of parties across the energy and environmental realm who have weighed in with briefs to the high court (*Greenwire*, Oct. 12).

Adoption of FERC's Order 745 was controversial at the time of its adoption.

Republican Commissioner Philip Moeller at the time issued dissent, in which he argued that organized markets should continue to develop their own rules regarding demand-response compensation. He also expressed concern the rule would grant preferential treatment for demand resources in some cases and discriminate in other cases.

Tony Clark, another Republican FERC commissioner, has also said the rule erred in requiring demand-response providers to be compensated in the energy markets at the same rate as an electric supply offer (*Greenwire*, June 12).

Clark and FERC Chairman Norman Bay were among those present for the arguments today.

Today's arguments were heard by eight justices; Justice Samuel Alito was recused from the case.

A decision in the consolidated cases -- *FERC v. Electric Power Supply Association* and *EnerNOC v. Electric Power Supply Association* -- is due by the end of June.

Reporter Hannah Northey contributed.

TRANSPORTATION:

As hopes for repatriation deal fade, focus shifting to 2017

Sean Reilly, E&E reporter

Published: Wednesday, October 14, 2015

There is one idea with strong, bipartisan consensus in the heated and perennial debate over transportation funding: Build a path to paying for a long-term highway bill by running it through the mountain of cash that U.S. multinationals have stashed overseas out of the IRS's reach.

President Obama likes that game plan; so does House Ways and Means Chairman Paul Ryan (R-Wis.) and a host of other lawmakers on both sides of the aisle.

But while the concept has bipartisan support, hopes for a hard-and-fast deal to tap that estimated $2 trillion trove have withered. With it could go any chance of enacting a major transportation funding package both this year and next, when the politics of the presidential election are likely to pose yet another complication, some observers predict.

"If we don't get anything done between now and the end of the calendar year, we'll be looking at 2017," said Scott Bogren, communications director at the Community Transportation Association of America, an advocacy group whose members include rural and small-town transit agencies.

The latest blow came earlier this month, when Ryan and Sen. Charles Schumer (D-N.Y.) admitted that they were still far from an agreement on using an international tax code overhaul to raise money for road and transit programs. As a result, the House Transportation and Infrastructure Committee, which today announced an Oct. 22 markup for its version of a surface transportation bill, could go forward with no strategy for fully covering the cost.

Although the notion of linking transportation to tax code changes will remain attractive, bridging the political and policy differences to get a bill through Congress is "going to be a real challenge," said Jon Traub, a former Ways and Means staff director who is now managing principal of the tax policy group at Deloitte Tax, a consulting firm.

The scope of the challenge was evident early last year when then-Ways and Means Chairman Dave Camp (R-Mich.) put it on the political map as part of an ambitious blueprint for a broader tax code revamp. Over eight years, his proposal would have raised almost $127 billion for transportation, or roughly enough to end the crises that have repeatedly forced the federal government to the brink of spending cuts and delays.

Camp's plan never got a serious look from his own committee. House Speaker John Boehner (R-Ohio) dismissed its complexities as "Blah, blah, blah." But with Republican leaders dead set against raising the federal gas tax, "repatriation" -- as the concept of bringing home corporate earnings held overseas is known in legal shorthand -- seemed the only politically viable approach to raising more money for road and public transportation projects.

The concept has a special allure for Republicans eager to lower the existing 35 percent corporate income tax rate, which, in their view, hurts the competitiveness of U.S. businesses and encourages all large corporations to leave money off shore.

Camp's plan, for example, would have set the rate on overseas earnings at 8.75 percent, a level incorporated into H.R. 625, a bill by Reps. John Delaney (D-Md.) and Richard Hanna (R-N.Y.) that has 22 other co-sponsors. In his fiscal 2016 budget request, Obama proposed a one-time 14 percent "transitional" tax on earnings currently held off shore as a prelude to a broader restructuring. And in S. 981, Sens. Rand Paul (R-Ky.) and Barbara Boxer (D-Calif.) offer a 6.5 percent rate.

None of those proposals has gained traction; tensions over the repatriation issue ran high enough at a June hearing of the House Ways and Means Subcommittee on Select Revenue Measures that Chairman Dave Reichert (R-Wash.) jokingly recalled his old job as a police officer and hostage negotiator (*E&E Daily*, June 25).

Not only is tackling the tax code a hard assignment, the two parties are sharply at odds over how much money a repatriation plan should raise.

"For Democrats to want to do this deal, we want to see infrastructure funding at levels above where we are now," Delaney said in an interview last week. "Not just like a couple of percentage points, but something a little more material than that."

"We need a really robust transportation number," Schumer, the No. 2 Democrat on the Senate Finance Committee, echoed in a separate conversation. "Chairman Ryan is trying his best to get there, but it's hard given all of their rules."

In an emailed statement, a Ryan aide acknowledged that the level of transportation spending "continues to be a significant issue." Because the current stopgap road and transit funding measure expires Oct. 29, Ryan is encouraging House T&I Chairman Bill Shuster (R-Pa.) to move ahead with a new bill that "does not assume a contribution from international tax reform," the aide said. Talks with Democrats will meanwhile continue.

Democrats are also sensitive to accusations that repatriation will reward wealthy corporations for gaming the existing system. Last year, almost three-quarters of Fortune 500 companies operated subsidiaries in the Cayman Islands and other "tax haven" jurisdictions, according to a report released last week by the U.S. Public Interest Research Group and Citizens for Tax Justice, two liberal-leaning research and advocacy organizations.

California-based Apple, for example, has booked some $181 billion offshore; if the firm had to pay U.S. taxes on those profits, the report said, it would owe more than $59 billion after accounting for foreign levies already paid.

Republicans, however, are more worried by the perception that repatriation would represent a tax increase.

Because the Obama's administration's proposed 14 percent tax would apply to offshore earnings whether or not corporations bring that money back to the United States, "you must know that that has to be a nonstarter on our side of the aisle," Sen. Tim Scott (R-S.C.) told Treasury Secretary Jack Lew at a Finance Committee hearing early this year.

In today's news release announcing the Oct. 22 markup of a surface transportation bill, Shuster did not say how many years the bill would cover or whether he will propose a way to address the cost. The legislation's text will be posted online tomorrow, a spokesman said.

Because there's no chance that lawmakers can send a final long-term bill to Obama in the next two weeks, another stopgap authorization will be needed in the interim to keep federal transportation dollars flowing after this month.

Longer-term key senators are pressing the House to take up H.R. 22, a road, rail and transit authorization measure passed by the Senate in July. The bill contains three years of assured funding, paid for in part by oil sales from the Strategic Petroleum Reserve and reductions in the dividend rate for some banks that belong to the Federal Reserve.

Finance Chairman Orrin Hatch (R-Utah) said last week that he expected the House to accept the Senate bill. In a floor speech, Boxer urged House members to move ahead immediately.

But key House members in both parties have shown no enthusiasm for the Senate legislation. A Ryan spokesman did not reply to an email asking whether his boss now supports the Senate funding package. Rep. Peter DeFazio of Oregon, the T&I committee's top Democrat, contends that the bill's spending levels are too low.

But while House Democrats initially viewed the Senate bill -- and its funding mechanisms -- as "dead on arrival," Delaney said, "it sounds like we're going to have to start looking at them again."

BIOFUELS:

DuPont letter blasts Sen. Toomey's RFS stance

Amanda Reilly, E&E reporter

Published: Wednesday, October 14, 2015

Executives at DuPont today chastised Sen. Pat Toomey (R-Pa.) for his position on the renewable fuel

standard.

In a letter, the DuPont executives said they "absolutely oppose" the senator's efforts to eliminate the corn ethanol portion of the RFS. DuPont, which is aiming to open an advanced biofuel facility in Iowa at the end of the month, argued that eliminating ethanol mandates would hurt the nascent advanced biofuels industry.

"We implore you to reconsider your stance on the RFS and work with us to create the right incentives for the biofuels industry to move beyond current technologies," the letter dated today says.

DuPont Executive Vice President James Collins, Industrial Biosciences President William Feehery and Biorefineries Global Business Director Jan Koninckx led the letter. Nearly 40 other DuPont employees are included as signatories.

Congress enacted the most recent version of the RFS in 2007 to require that refiners blend increasing amounts of ethanol and advanced biofuel into petroleum gasoline and diesel.

Toomey has long opposed the corn ethanol portion of the mandate, arguing that it hurts small refiners in his state. The senator earlier this year introduced bipartisan legislation with California Sen. Dianne Feinstein (D) to strike corn ethanol from the RFS.

"Under government mandates, refiners -- such as ours in Trainer, Pa. -- are forced to make a choice: increase the ethanol content in their fuel blends or pay a penalty by purchasing credits from energy traders," Toomey said earlier this year. "Once again, this is the government using corporate welfare to shower money on a favored industry and then send the bill to the general public."

Toomey was recently unsuccessful at adding the language to a Senate bill to overturn the 40-year-old ban on crude oil exports (*Greenwire*, Oct. 1).

Biofuel producers have strongly objected to the proposed legislation, arguing that it would not only hurt the ethanol industry but also the advanced biofuel industry, which has struggled to stand on solid feet despite the RFS requirements.

"Proposals to modify the RFS will undercut the existing U.S. biofuels industry, preventing all new opportunities for investments in cellulosic ethanol and advanced biofuels," the DuPont officials said in their letter.

DuPont has planned an Oct. 30 grand opening for its new biorefinery in Nevada, Iowa, after being delayed for about a year.

The facility is expected to produce 30 million gallons a year of cellulosic ethanol out of corn crop residues collected from local farmers. Cellulosic ethanol refers to ethanol made from plant materials such as agricultural residue, woody biomass and perennial grass.

Along with warning that repealing the ethanol mandate would undercut investment in advanced biofuels, the DuPont letter also said that Toomey's legislation could adversely affect Pennsylvania. The letter credited the renewable fuels industry with driving $3.6 billion in economic output in the Keystone state.

"Repealing the corn ethanol portion of the RFS would have significantly negative economic impacts for Pennsylvania and the U.S.," DuPont wrote, "and prevent additional growth in biofuels."

CAMPAIGN 2016:

Candidates frame argument for climate action in security terms

Jennifer Yachnin, E&E reporter

Published: Wednesday, October 14, 2015

Democratic presidential primary contenders reiterated their near-unanimous support for taking action to combat climate change in the party's first debate last night, but several candidates also showcased a change in tactics by embracing programs to reduce carbon emissions as a national security issue.

In a two-hour-long debate hosted by CNN, Democratic contenders led by former Secretary of State Hillary Clinton and Vermont Sen. Bernie Sanders (I) repeatedly raised their concerns about the need to address global warming, whether with policies such as a carbon tax or tax benefits for the renewables industries.

"Today, the scientific community is virtually unanimous: Climate change is real, it is caused by human activity, and we have a moral responsibility to transform our energy system away from fossil fuel to energy efficiency and sustainable energy and leave this planet a habitable planet for our children and our grandchildren," said Sanders, one of four candidates along with Clinton, former Maryland Gov. Martin O'Malley and former Rhode Island Gov. Lincoln Chafee to address climate change policy in his opening remarks.

Clinton, the front-runner for the Democratic nomination, hit on the green-jobs argument, saying that the nation must take "the opportunity posed by climate change to grow our economy" in her opening remarks.

The candidates did not mention the Obama administration's Clean Power Plan to address carbon emissions from power plants. But the field also put new emphasis on another pitch for climate change policy: national security.

Both Sanders and O'Malley cited climate change when asked by moderator Anderson Cooper to name the greatest security threat facing the United States.

"The scientific community is telling us that if we do not address the global crisis of climate change, transform our energy system away from fossil fuel to sustainable energy, the planet that we're going to be leaving our kids and our grandchildren may well not be habitable. That is a major crisis," Sanders said.

O'Malley, who has previously asserted that the Syrian civil war and the subsequent rise of the Islamic State group in the Middle East were spurred in large part by a climate-change-induced drought in the region, similarly pointed to climate change in his response.

"Climate change, of course, makes cascading threats even worse," O'Malley said.

While that apparent shift among Democratic presidential contenders to frame climate change policy as a security issue may be a new tact on the campaign trail, League of Conservation Voters Senior Vice President of Campaigns Daniel Weiss noted that it is not a new argument.

"The candidates that talked about climate change as a national security threat are only saying the same thing that the Pentagon and the CIA have been warning for years," Weiss said, pointing to a 2014 Defense Department report that named climate change as an immediate threat to national security.

But Weiss acknowledged that highlighting the connection between global warming and national security could help candidates strengthen the case for climate change policies.

"Americans are generally more focused on domestic impacts and opportunities from climate change, but there is a security element to it," Weiss said.

During the debate, Sanders also sought to link another issue to climate change policies, arguing that until Congress addresses campaign finance reform, lawmakers are unlikely to enact policies aimed at reducing carbon emissions.

"Nothing is gonna happen unless we are prepared to deal with campaign finance reform, because the fossil fuel industry is funding the Republican Party, which denies the reality of climate change and certainly is not prepared to go forward aggressively," Sanders said.

COAL:

Tapes show Don Blankenship knew about Massey safety lapses

Published: Wednesday, October 14, 2015

Recordings that former Massey Energy Co. CEO Don Blankenship made of his phone calls are being used by prosecutors to show him conspiring to break mine safety laws and financial regulations.

In the recordings played yesterday in federal court, Blankenship said he occasionally believed that without federal mine regulators, "we'd blow ourselves up" (*Greenwire*, May 4).

Blankenship is being prosecuted regarding safety practices at West Virginia's Upper Big Branch mine, which killed 29 miners when it exploded in 2010 (*E&ENews PM*, Sept. 30).

The former CEO was also recorded wanting to mention safety efforts in a press release after the explosion as "a chance to do some propaganda there," wanting to suppress a former Massey official's safety memo because it shed a bad light on the company if it resurfaced in a legal case, and not believing that black lung prevention efforts were worth the time and effort.

The defense has argued that Blankenship was not personally running the Upper Big Branch mine and that he was not the kind of person to knowingly violate safety regulations (Jonathan Mattise AP/Minneapolis *Star Tribune*, Oct. 13). **– BTP**

OIL:

Industry lobbyist mum on possible exports-for-renewables deal

Geof Koss, E&E reporter

Published: Wednesday, October 14, 2015

The head of the American Petroleum Institute today repeatedly declined to offer an opinion as to whether the group would support a legislative compromise to lift the crude oil export ban in exchange for extending key renewable energy tax incentives.

API President and CEO Jack Gerard told reporters he was "heartened" by Senate Minority Leader Harry Reid's August comments that the Nevada Democrat was open to talks of lifting the ban if more tax credits for renewables are on the table (*Greenwire*, Aug. 25).

Reid's comments echoed a sentiment expressed by other Senate Democrats, who have argued that a boost for the oil sector should include help for renewables.

"You've heard about a half dozen more who've said, 'Hey, I'm open to this, but I'd like to look at this issue.' Or 'I'd like to look at this issue,'" Gerard said on a conference call. "Very few other issues have as much momentum as this one does."

But after citing Reid's comments, Gerard deflected repeated questions over whether the industry could get behind an agreement built on the top Senate Democrat's suggestion of linking crude oil exports to renewable energy tax breaks.

"I think there's a variety of options out there," Gerard said. "We could probably identify 20 to 30 paths to success here. I do think it is significant that you're hearing more and more say we could work something out here. People see that momentum."

Pressed further, Gerard sought to pass the buck to congressional leaders, while arguing that a change in exports policy should be based on the merits.

"I think we're in the early stages of what will somebody do, what will somebody offer? We're not really focused on that right now," he said. "We'll leave that to the leadership. Our focus is this is good for the American people, it's good for the American economy, it's good for American consumers. We're for it, and we're going to continue to advocate for it."

Gerard's hesitation on the question highlights the intense political pressure that an exports-for-renewables deal entails, given that Democrats would likely target the billions in dollars in tax breaks the oil and gas industry enjoys as a way to pay for extending the production tax credit, the investment tax credit or both.

Asked again about a possible deal, Gerard reiterated comments he made Friday after the House easily passed legislation lifting the ban, when he criticized suggestions that Congress impose new taxes on the industry in exchange for greenlighting exports (*Greenwire*, Oct. 12).

"Let me tell you what we strongly oppose," he said. "There have been some who have suggested we need to go back and put a tax on the domestic oil and gas industry. That's one of the sillier proposals I've heard. Why would you go and raise the cost to the American consumer, to the American producer, to make them noncompetitive in exchange for the ability to be competitive by going into the global marketplace?"

After declining to provide the "yes or no" answer one reporter demanded to a "straightforward" question about a deal, Gerard indicated the industry's preference for a simple legislative repeal.

"The cleanest, clearest path to success is just a straight up-and-down bill that says lift the ban on crude oil exports in the United States," he said.

But Gerard paused when pressed on whether there's enough Democratic votes to move such a bill through the Senate.

"Again the process will determine that, but I think there's strong Democratic support for lifting the ban on crude oil exports," he said.

Nonetheless, Gerard predicted that a repeal will happen before the end of the year, citing a number of must-pass bills as potential vehicles.

"It's our expectation that the crude export ban will be lifted this year," he said.

ENERGY POLICY:

Moniz touts rules, smart grid as boon to U.S. climate goals

Jean Chemnick, E&E reporter

Published: Wednesday, October 14, 2015

Correction appended.

Energy Secretary Ernest Moniz pledged today that his department will spend the next 15 months doing everything it can to improve U.S. energy efficiency, both by promulgating rules and by modernizing the power grid.

"We are scheduled to roll out more than 20 additional efficiency rules in the remainder of this administration, kind of driving the system to the breaking point," Moniz told a Washington, D.C., hotel ballroom full of smart grid experts. "But we think it's really important to go there."

DOE has already introduced numerous efficiency rules for consumer products from refrigerators to fluorescent lamps. Many have been unveiled since President Obama launched his second-term Climate Action Plan two years ago, and the administration's social cost of carbon estimate figures in its cost-benefit analyses.

It is particularly important to cut energy consumption, Moniz noted, because the power sector emits more carbon dioxide than any other sector of the U.S. economy. That fact prompted U.S. EPA to issue its Clean Power Plan to cut utility emissions. But he told those attending the National Summit on Smart Grid and Climate Change that DOE rules and programs would work in tandem with the marquee EPA rule to cut demand for power and facilitate the deployment of low-carbon alternatives to fossil fuels, including distributed solar generation.

"To get our emissions reduction targets and avoid the worst effects of climate change -- we can't avoid all of them, we know -- we certainly need to reduce power-sector emissions significantly," he said. "In fact, most think that as we go to a very low-carbon future, electricity really has to be a leader in decarbonization."

The United States has pledged in a submission to the United Nations that it will cut its greenhouse gas emissions between 26 and 28 percent compared with 2005 levels by 2025. The Clean Power Plan, which would reduce power-sector CO2 by 32 percent by 2030, is a major component of that pledge.

Besides regulation, Moniz also touted DOE's investment in smart grid and grid modernization efforts as a means not only of cutting emissions but of making the grid more resilient. Most of those investments were made with resources from the 2009 economic stimulus package that closed out in fiscal 2015.

But DOE invested $4.5 billion under the act in grid modernization, leveraging an additional $5 billion in private capital for smart grid technologies.

"We believe these investments have already produced tangible benefits," he said. Smart grid tools help improve reliability, allowing system operators to more nimbly manage the grid and facilitating the deployment of more intermittent renewable energy.

Distribution systems that use smart grid technology are 3 percent more efficient, using less fossil fuels

and cutting emissions in the process, Moniz noted.

It is particularly important to improve the resiliency of the grid, he said, because severe weather events are the most common cause of outages and they are on the rise. But he noted that Congress controls whether DOE receives the funds it asks for each year to make those improvements.

The fiscal 2016 budget request includes funds for research and development to improve resilience of large-scale transformers, and $14.5 million to transition to an integrated system at the distribution level and to develop a platform for market-based control systems, among other things.

"We are very committed to the grid of the future, because we think this is absolutely central for our economy, for our environment, climate change as we head to Paris, and for energy security and resilience," Moniz said.

But while prospects for moving funding and authorizing legislation through a GOP-controlled Congress remain uncertain, Moniz noted that DOE's federal Quadrennial Energy Review -- mandated under the Climate Action Plan -- and the Quadrennial Technology Review have both been referenced in energy bills now making their way through the House and Senate.

"We've been very pleased about how the QER in particular, since it came out in April, I think it's fair to say changed the nature of the discussion," he said. "It has done exactly what it was meant to do."

The QER seeks to provide a policy road map for future efforts to modernize the power grid and reduce its emissions (*Greenwire*, April 21).

***Correction**: An earlier version of this article quoted Ernest Moniz as saying there would be "more than 200 additional efficiency rules in the remainder of this administration;" there will be more than 20 additional efficiency rules. Also, the fiscal 2016 budget request was said to include $14.5 billion for several projects; the request was for $14.5 million.*

NEGOTIATIONS:

14 carbon-intensive companies call for 'balanced' Paris deal

Jean Chemnick, E&E reporter

Published: Wednesday, October 14, 2015

Fourteen companies from carbon-intensive industries issued a statement today calling for this year's U.N. climate talks to produce a "more balanced and durable multilateral framework" to guide national efforts to contain warming.

The companies that signed on to the statement coordinated by the Washington, D.C.-based Center for Climate and Energy Solutions (C2ES) ranged from aluminum producers to utilities to petroleum corporations.

All the companies are part of an informal C2ES working group on Paris.

"We recognize the rising environmental, social, economic, and security risks posed by climate change, and that delaying action will result in greater risks and costs," the statement says. "We stand ready to work with governments and our civil society partners to deliver and implement a sensible and effective global climate agreement in Paris."

The French presidency of this year's round of U.N. climate talks, which begins in Paris at the end of November, has said that corporations should play a role in helping to foster an agreement. And many corporations have made new pledges of their own ahead of the conference, including Goldman Sachs Group Inc., Wal-Mart Stores Inc. and seven other U.S. companies that vowed last month to transition to 100 percent renewable electricity use.

The participants in today's statement are based in the United States or have major operations here, but most are multinational corporations that also have interests abroad and face foreign competition. The statement calls for the Paris talks to produce an accord that covers all major economies and that provides for transparency of domestic actions and policies -- both important parts of the U.S. negotiating position.

The list includes Alcoa Inc., a lightweight metals manufacturer that also signed a pledge in July at the White House with a dozen other companies that they would spend a collective $140 billion to combat warming and endorse "a strong outcome in the Paris climate negotiations" (*ClimateWire*, July 27).

Other companies that signed today's C2ES statement included Alstom Inc., BHP Billiton Ltd., BP PLC, Calpine Corp., Hewlett-Packard Co., Intel Corp., LafargeHolcim, National Grid, Pacific Gas and Electric Co., Rio Tinto Group, Schneider Electric, Shell Oil Corp. and Siemens Corp.

The statement is part of ongoing C2ES efforts to focus attention on the opportunity for a meaningful agreement in Paris. Earlier this year, C2ES released a co-chairs report from a yearlong dialogue it held with negotiators from China, the United States and 20 other countries laying out key elements of a balanced and durable agreement.

ALTERNATIVE FUELS:

Toyota plans to eliminate CO2 emissions by 2050

Published: Wednesday, October 14, 2015

Toyota Motor Corp. announced today that it's planning to eliminate carbon emissions from its factories by 2050 through renewable energy and hydrogen-based production.

The company also said it plans to sell more than 30,000 fuel-cell vehicles after 2020 and 1.5 million hybrid vehicles by 2020.

Toyota is looking to boost the sales of its popular Prius model, which has seen declining sales because of low gas prices (Reuters/*Las Vegas Review-Journal*, Oct. 13). **-- BTP**

AIR POLLUTION:

EPA hasn't decided if Volkswagen's new software is legal

Published: Wednesday, October 14, 2015

The legality of a new emissions-control device on Volkswagen's 2016 diesel models hasn't been determined yet, a U.S. EPA official said yesterday.

"We have a long list of questions for VW," said EPA's acting assistant administrator, Janet McCabe, at a press conference in Detroit. "When we have all of the answers, we will be able to make a determination."

Volkswagen revealed last month that it had illegally installed software in its "clean diesel" vehicles to fool emissions tests (*ClimateWire*, Sept. 21).

Michael Horn, Volkswagen's U.S. executive, revealed the existence of the new software last week during his testimony before a congressional subcommittee (*Greenwire*, Oct. 8). He said Volkswagen had withdrawn its application for EPA certification of 2016 diesel models.

The company said Monday that it is "working with regulators to continue the 2016 certification process" for Volkswagen vehicles (Paul Lienert, Reuters, Oct. 13). **-- BTP**

AIR POLLUTION:

EPA rolls out new standards for aluminum producers

Amanda Reilly, E&E reporter

Published: Wednesday, October 14, 2015

Aluminum production facilities will be subject to new standards for several air pollutants, as well as face new work practice and monitoring requirements under a new rule that will be published tomorrow.

The rule represents an update to 1997 standards for primary aluminum production facilities. Those facilities make aluminum out of refined bauxite ore using a "potline" process in which electrolytic reduction takes place in a series of cells, or pots.

U.S. EPA finalized the new standards last month after a risk and technology review. The rule will be published tomorrow in the *Federal Register*.

"Once the final standards are in place," EPA said in a fact sheet, "the public health and environment will be protected with an ample margin of safety."

According to EPA, there are 11 facilities in nine states that produce aluminum from refined bauxite ore.

The new rule sets technology-based standards for particulate matter as a surrogate for hazardous metals. It also sets standards for polycyclic organic matter, carbonyl sulfide, mercury, polychlorinated biphenyl, dioxin and furan emissions.

For older facilities, the rule establishes new risk-based standards for polycyclic organic matter, arsenic and nickel emissions. The emissions limitations included in the rule begin to take effect in one year.

Facilities also will be subject to new work practice standards during startup, shutdown and malfunction events at facilities, as well as new monitoring requirements.

EPA earlier this year updated its air toxic standards for secondary aluminum production, or the production of aluminum out of scrap materials.

AIR POLLUTION:

Port of Los Angeles failed to reduce smog, noise

Published: Wednesday, October 14, 2015

The Port of Los Angeles has not conducted critical pollution-reduction measures that it agreed to in a legal settlement more than a decade ago, according to a document distributed by the port.

The environmental notice released by the port showed that 11 of the 52 measures agreed to by the port to reduce air pollution, noise and traffic had not been completed. The measures came as part of a 2003 settlement with residents and community groups that had sued to block the expansion of the China Shipping terminal (*Greenwire*, March 6, 2003).

Port officials said yesterday that the inaction was the fault of previous administrators and promised to rectify things. "We are committed to ensuring that something like this never happens again," said Executive Director Gene Seroka.

Residents and community groups felt cheated after the revelation, however.

"This whole time we've been led to believe that this is a much cleaner project than it has been," said Mark Lopez, who leads East Yard Communities for Environmental Justice (Tony Barboza, *Los Angeles Times*, Oct. 14). **-- BTP**

CCAP's Helme discusses need for private financing to meet Paris goals

Published: Wednesday, October 14, 2015

How will private-sector investments factor in to the overall success of December's anticipated Paris climate agreement? During today's OnPoint, Ned Helme, president of the Center for Clean Air Policy, discusses the financing framework that will be needed to ensure the goals of a Paris agreement are met. He also talks about the role of coal internationally and how its expanding use in some countries impacts efforts to reduce emissions.

Why wealthy Singapore resists tough domestic climate action

SINGAPORE -- This is a rich island nation, and despite pressures to help combat climate change, it fully intends to stay that way. Standing on the peak of Jurong Hill, looking out across a man-made isle off the mainland bearing the same name, it's easy to see why. Manufacturing facilities crowd the artificial land mass. Silver-colored storage tanks and giant chimneys painted in red and white indicate its status as one of the top three oil refining centers in the world. Under the United Nations' 20-year-old climate change agreement, Singapore is considered a developing country exempt from the emissions cuts that are mandatory for a handful of industrialized nations. But as governments prepare to sign a new accord in Paris in December, those old divisions are fading away.

Volkswagen recalls 8.5 million 'clean diesel' vehicles in Europe

By KYLE FELDSCHER

Volkswagen will recall 8.5 million "clean diesel" vehicles in Europe because of software that allows the vehicles to cheat emissions tests, the German automaker announced Thursday morning.

The recall does not include the approximately 482,000 similar vehicles in the United States that have been identified by the Environmental Protection Agency and the California Air Resources Board as containing the same "defeat device" software.

According to a statement from Volkswagen, the recall involves 2.4 million vehicles in Germany and 8.5 million across Europe. Outside of the 28 European Union countries involved in the recall, it will be up to each individual country to work with the company to come up with its own plan for a recall.

"Work on the technical solutions detailed in the plan of measures is currently proceeding at full

speed. Remedial action on the vehicles will begin in January 2016 — at no cost to our customers," the company said. "The technical solutions can involve software as well as hardware measures. These are currently being developed for each affected series and each affected model year."

The EPA and the California Air Resources Board are investigating Volkswagen for installing "defeat devices" that allow vehicles to skirt emissions tests. The devices allowed popular models, such as the Jetta, to tell when they were undergoing emissions testing.

The defeat device is about 100 million lines of software code written into the vehicle's programming.

The software could tell if a test was taking place based on the position of the vehicle's steering wheel, the speed the vehicle was traveling, how long the engine was being used and barometric pressure, according to the EPA. The vehicles would reduce emissions of nitrogen oxide during testing and then spew 40 times the legal limit during normal use.

Volkswagen officials are blaming "rogue software engineers" for the devices.

Two congressional committees are investigating the scam with law enforcement authorities in Germany.

The recall in Europe gives some clues to how a similar recall may work in the United States when it eventually comes about.

European VW owners are currently able to look up whether their vehicle contains a defeat device on the company's website. The company says it will also tell the owners of the affected vehicles over the next weeks and months what measures will have to be taken to fix their vehicles.

The company emphasized, as has the EPA, all of the vehicles are safe to drive and can stay on the road.

Europe's love affair with diesel cars has been a disaster

Updated by Brad Plumer on October 15, 2015, 1:00 p.m. ET @bradplumer brad@vox.com

The recent news that Volkswagen had been illegally rigging its diesel-powered cars to cheat on pollution tests has sparked plenty of outrage. Hearings, lawsuits, fines, general opprobrium. And rightly so; the company's deception was appalling.

But there's a much broader, far more consequential problem here that a lot of coverage has danced around or hinted at only indirectly. So let's say it: Europe's longtime promotion of diesel vehicles as a "green" transportation option has been a complete and total disaster — for reasons that go well beyond the Volkswagen scandal.

Ever since the 1990s, European governments have been encouraging drivers to buy diesel cars as an alternative to traditional gasoline-powered vehicles. The rationale was simple: Diesel engines use fuel more efficiently, so the switch was supposed to reduce carbon dioxide emissions and help stave off global warming. Thanks to tax breaks and other incentives, diesel cars now make up one-third of Europe's fleet, whereas they're a sideshow in the US and Japan:

Europe's diesel push might have seemed sensible once upon a time. But 20 years later, with the benefit of hindsight, it looks like a huge mistake, an impotent climate policy that had all sorts of unintended consequences.

The biggest drawback of diesel cars is that they emit higher levels of other harmful air pollutants like particulates and nitrogen oxides. And those ended up being far harder to clean up than experts initially predicted. We now know that Europe's regulators have failed spectacularly to control diesel pollution, relying on weak rules and flimsy testing procedures. Lots and lots of automakers — not just Volkswagen — have been manufacturing diesel cars that emit far more gunk than they're supposed to. As a result, cities like London and Paris are clogged with dangerously high levels of air pollution, causing thousands of premature deaths each year.

And that's not the worst part. It's now looking like Europe's diesel push didn't even do anything to help global warming, as one 2013 study by Michel Cames and Eckard Helmers found. The CO2 benefits from switching to diesel cars were overrated and offset by the extra soot their engines produced. Plus, Europe's entrenched diesel industry has impeded progress on more promising hybrid and electric car technologies that could've provide deeper emissions cuts.

The whole episode is a sobering case study in how well-intentioned green industrial policy can go horribly wrong. So let's roll the tape and see what lessons we can learn from Europe's decades-long diesel fiasco.

Why Europe embraced diesel cars in the 1980s and '90s

Tributes And Reaction To Paris Terror Attacks After Gunmen Kill 17 People

(David Ramos/Getty Images)

After crude oil gets pumped out of the ground, it's sent to refineries to be turned into usable fuel. Those refineries typically distill the oil into lighter and heavier components. The lightest stuff includes gasoline. On the heavier side is diesel fuel, which contains more energy per gallon.

For most of the 20th century, automakers largely designed cars to run on gasoline, which was more flammable and combusted easily using sparks. Engines that could combust diesel fuel, using air compression, had been invented in the 19th century, but they were noisier and belched more smoke, so they were mostly confined to large ships and trucks. Diesel was often used instead for heating and producing electricity.

But starting in the 1980s, French and German automakers began showing more interest in developing diesel-powered cars. The reasons have always been a little murky, although Cames and Helmers suggest it traces back to the OPEC oil crises of the 1970s. After global crude prices spiked, France decided to swear off using diesel for electricity and built a bunch of nuclear plants instead. Germany, meanwhile, switched from oil to natural gas for heating. When the crisis finally subsided, Europe's refiners were still producing lots of diesel with no buyers. So governments began urging automakers like Peugeot to look into diesel-powered vehicles.

By the late 1990s, diesel technology had improved dramatically, thanks to advances in fuel injection — common rail, especially — that allowed the engines to run more quietly. The newer diesel engines were a technical marvel, operating more efficiently than their gasoline counterparts and using less fuel per mile traveled (and, hence, emitting less carbon dioxide per mile). All they needed was a market.

Rising concern over global warming provided that push. In 1997, the European Union signed the Kyoto Protocol and committed to cutting its heat-trapping carbon dioxide emissions roughly 8 percent by 2012. The next year, the EU reached a landmark agreement with the continent's car manufacturers on reducing CO2.

At the time, there were lots of different paths Europe's automakers could have taken to green itself. They could've pursued direct injection technology for gasoline vehicles, making those engines more fuel-efficient. They could've ramped up R&D of hybrid electric car technology, as Japanese automakers like Toyota were starting to do. But European companies like Peugeot and Volkswagen and BMW had already been making big investments in diesel, and they wanted a climate policy that would allow those bets to pay off.

Europe's policymakers obliged. The EU agreed to a voluntary CO2 target for vehicles that was basically in line with what diesel technology would be able to meet. As researcher Sarah Keay-Bright later noted, these standards were explicitly crafted so as not to force Europe's automakers to develop hybrids, electric vehicles, or other more advanced power trains.

Soon thereafter, European nations — including Britain, France, Germany, Italy, Spain, and Austria — began cutting taxes on diesel fuel and diesel car purchases to promote sales, all in the name of thwarting climate change. Diesel sales soared. Back in 1990, just 10 percent of new car registrations in Europe had run on diesel. By 2011, that had climbed to nearly 60 percent.

Today, Europe's diesel cars are a public health nightmare

Diesel engines do have one big pitfall. They may be more fuel-efficient and emit less CO2, but their engines tend to emit higher levels of other nasty air pollutants, including soot, particulates, and nitrogen oxides (NOx). Heavy exposure to these air pollutants can exacerbate heart and lung disease, trigger asthma attacks, and even cause premature death.

Everyone knew this back in the 1990s. Europe's regulators simply considered the trade-off acceptable. "At the time, the prevailing belief was that climate change was the really hard problem and should be the priority, whereas we'd had experience improving air quality, so everyone assumed we could easily fix that issue later," explains Martin Williams, an air pollution researcher at King's College London who previously worked for Britain's environmental agency.

That assumption turned out to be wrong. When European regulators later moved to clamp down on NOx and other conventional air pollution from diesel vehicles, they failed miserably.

Starting in 2000, the EU began ratcheting down the legal limits for NOx emissions (though Europe's diesel cars have always been allowed to emit NOx at a relatively higher rate than gasoline-powered cars). New vehicles were tested in laboratories, where cars were placed on giant treadmills, spun through a few exercises, and measured for pollution.

Trouble was, these tests turned out to be incredibly flimsy and easily gamed, explains John German of the International Council on Clean Transportation. Automakers could send cars to labs that were optimized for testing: stripped of excess weight, with the air conditioning turned off, and so on. The test cars complied with the pollution limits just fine. But the cars that were actually being sold to consumers were quite different, with much higher emissions. (German says this sort of subtle gaming was technically legal, unlike Volkswagen's more elaborate deception, which involved illegal software that only turned pollution controls on during tests. Still, even if Volkswagen was the most flagrant cheater, it was hardly unique.)

Few realized the EU's pollution tests were badly flawed until 2010, when researchers started studying emissions from vehicles that were actually on the road. In one study, Williams set up

roadside infrared detectors to measure NOx pollution from cars in seven British cities. What he found was shocking: Europe's newest diesel cars were emitting roughly as much NOx as older diesel cars from the 1990s.

In other words, 20 years of increasingly strict air pollution regulations had done absolutely nothing to reduce pollution. "That was the most surprising part," Williams says.

By that point, the damage had been done. Today, Paris occasionally jousts with Beijing for the title of world's most polluted city. London is grappling with unsafe levels of nitrogen dioxide. Germany, Austria, and Ireland have NOx pollution well above the legal limits.

And the health toll has been staggering. One recent study found that diesel pollution from cars, buses, and trucks in Britain caused 9,400 premature deaths in 2010 alone. It's difficult to suss out what fraction of those deaths might have been avoided if emission rules had been properly enforced all along, but that gives some sense of the brutal cost here.

To be fair, European regulators have scrambled to improve the tests now that they've realized what was happening. But it's still unclear whether the diesel car industry can ever clean up its act.

Starting in 2014, the newest, most stringent emissions standard — known as Euro 6 — will require diesel cars to emit no more than 0.08 grams of NOx per kilometer, an 84 percent reduction from 2000-era levels. Europe's regulators will also start requiring on-road testing in addition to laboratory checkups. (That's what the United States EPA does, and it should eliminate most gaming, although, as the Volkswagen scandal showed, truly determined cheaters are hard to detect.)

But here's the fat asterisk: Now that they can no longer easily game the system, Europe's automakers are lobbying hard to relax the pollution standards. That's because it's not very easy to cut NOx pollution from diesel cars. One of the technologies that could meet the most stringent limits, known as selective catalytic reduction, involves running the car's exhaust through a honeycombed chamber that sprays urea and water, which breaks the NOx down into harmless nitrogen, oxygen, and water molecules. But these devices can add about $5,000 to $8,000 to the price of a vehicle, which would make many small cars uneconomical. They can also negatively

affect fuel economy, torque, and other aspects of the car's performance.

So the jury's still out on whether "clean diesel" cars will even be viable in practice. Volkswagen had claimed to have cracked the problem with its most recent diesel models ... except we now know the company was doing it by rigging the cars with software to evade pollution tests.

The grim irony: Europe's diesel push hasn't helped with global warming

If Europe's diesel surge had helped mitigate climate change, then maybe (just maybe) you could argue that all this extra air pollution was worth it. Except here's the grim plot twist: The climate benefits appear to have been negligible.

In their 2013 paper, Cames and Helmers argued that Europe is probably worse off today, from a global warming perspective, than it would have been if automakers had just focused on improving gasoline-powered cars all along. And Europe is arguably much worse off than it would have been if automakers had started investing in hybrid electric technology back in the 1990s.

The authors offer up this chart, showing that Europe's diesel cars may have once had a sizable CO2 advantage over traditional gasoline vehicles. But today that gap has virtually disappeared, as new technologies like turbochargers have made gasoline engines nearly as efficient as diesel cars:

What's more, there are two subtle drawbacks to diesel engines that make them worse for global warming than they seem.

First, even if diesel cars emit less CO2 than gasoline vehicles, they emit a lot more black carbon, or soot, a pollutant that (we've recently learned) also contributes significantly to global warming. The precise accounting here is still subject to some dispute, but Cames and Helmers point out that black carbon emissions from diesel cars likely negate a big chunk of their CO2 advantage.

Second, remember that European countries encouraged diesel car adoption by slashing taxes on the diesel fuel itself (compared with gasoline). But as any Econ 101 student will tell you, cutting fuel prices gives people an incentive to drive more miles — and increase their overall emissions. This further chips away at any climate advantage diesel might have.

Add it up, and Cames and Helmers conclude that "the European diesel car boom did not cool down the atmosphere."

One final coda here. Go back and look at the Japanese cars on the graph above. Back in the late 1990s, Japanese automakers were also thinking about cutting CO2, but they figured that diesel was a dead-end technology, since the cost of cleaning up the extra NOx pollution would be too high. Instead, companies like Toyota started investing in hybrid vehicles, with the first Prius appearing in 1997. By contrast, Europe's automakers initially scoffed at electric powertrains, and none of them even bothered producing hybrids until Mercedes finally rolled one out in 2009.

Japan's decision now looks prescient, and Europe's looks shortsighted. Hybrids proved much greener: The newest Japanese cars now produce roughly 10 percent less CO2 per mile than Europe's diesel vehicles do, on average. And Japan's automakers appear to be better set up for the future. Many experts now think that transportation will eventually have to become electrified if we want truly deep reductions in emissions. But European automakers, stuck on diesel for so long, are scrambling to catch up.

Europe is now struggling to undo its diesel mistake — but it's not easy

Debate Over Vehicle Emissions Intensifies As Volkswagen Scandal Widens

Because of the Volkswagen scandal, and the staggering levels of pollution in cities like Paris and London, Europe's policymakers are now beginning to rethink their fondness for diesel cars. But it's a hard technology to give up. Path dependency is a hell of a drug.

In diesel-loving France, Ségolène Royal, the environment minister, recently said that the country would consider phasing out preferential tax breaks for diesel over the next five years. "We need to start preparing our move out of diesel," she reportedly told France 5 television. But she's also

bristled at any suggestion that France should act too quickly. After all, diesel cars still account for more than 60 percent of all European sales for Renault and Peugeot, two major local manufacturers. They can't just unwind those positions overnight.

Volkswagen, for its part, is also engaged in a bit of soul searching around diesel (at least, when it's not recalling its 11 million law-breaking diesel cars and dealing with criminal investigations). The company recently announced that it would take a major plunge into electric powertrains, creating a standardized architecture for a new wave of plug-in cars. "The Volkswagen brand is repositioning itself for the future," said executive Herbert Diess. Except, of course, this shift won't happen overnight. Because VW spent so many years dreaming up ways to evade regulators and sell diesel cars, it's now playing catch-up to electric car companies like Tesla.

In the meantime, Europe's smoggy cities still have to grapple with the fallout from all those polluting diesel cars that are still on the road — and will likely stick around for years. The EU has started to pressure countries with the worst air pollution. Cities like London, Stockholm, and Milan are already experimenting with emission-free zones. In the future, drivers with old diesel clunkers could have to pay extra to travel downtown in certain cities. But even this cleanup will take years.

Energy bets can sometimes go horribly wrong. So how do we avoid that?

Europe's misadventure with diesel cars is a great case study in how energy policy can go very badly awry, and no doubt there's a long list of lessons to draw. I'll just mention a few big ones:

First, Europe's complete failure to regulate diesel pollution is worth studying. Not only had regulators designed flimsy emissions tests — partly at the behest of industry lobbying — but it took two decades to even realize the tests were failing. Crafting ambitious environmental rules is all well and good, but without ample enforcement and monitoring, those rules are basically pointless. (Note that China is now pursuing ambitious climate policies of its own, but experts keep muttering that enforcement will be a big challenge — a caveat that deserves much more attention.)

Another possible takeaway is that if we really want to reduce greenhouse gas emissions from the transportation sector, liquid fuels are ultimately a dead end and electrification is the best path

forward. There's no shortage of experts who believe that, and certainly that's the lesson Volkswagen seems to be drawing from this fiasco. That said, it's worth noting that Toyota, which was ahead of the pack in developing hybrid electrics in the late 1990s, actually doesn't believe electric cars are the future and is pouring R&D into hydrogen cars instead.

Which brings us to the third takeaway. The future is hard to predict. Diesel cars seemed like a reasonable idea in the 1990s and a disaster today. That suggests that policymakers should have a lot more humility when crafting energy policy. One approach might be to pursue more technology-neutral policies organized around preferred outcomes — say, tightly enforced standards that require lower emissions — rather than favoring specific industries just because they happen to seem promising at that moment in time.

This issue comes up again and again. For years, governments have been laying down big bets on emerging clean energy technologies. France did it with nuclear power in the 1970s and '80s. Germany did it with wind and solar power in the 2000s, through feed-in tariffs. The United States did it with corn ethanol in 2005.

Done right, this sort of government support can be valuable, helping useful new energy options break into the mainstream against entrenched competition. But the biggest risk is that governments end up gambling on badly flawed technologies that then become the entrenched competition and prove impossible to get rid of. The US arguably made that mistake with corn ethanol, which has had unintended ripple effects on the food supply and deforestation and is proving politically difficult to wind down. Now it's clear that Europe made that mistake, too.

http://www.nbcnews.com/business/autos/let-recalls-begin-germany-tells-vw-fix-2-4-million-n445141

Let the Recalls Begin: Germany Tells VW to Fix 2.4 Million Diesels

by PAUL A. EISENSTEIN

About 2.4 million Volkswagen diesels sold in Germany over the last seven years will be recalled under an order issued Thursday by the Berlin government.

The move marks the first official recall of diesel vehicles that VW surreptitiously outfitted with software designed to meet emissions tests, then switch off pollution controls during real world operation. VW has said it produced about 11 million such vehicles with its EA 189 engine.

The scam was revealed last month by the U.S. Environmental Protection Agency. The EPA has yet to order a formal recall - though one is expected - in part because it has been working with VW to come up with an appropriate fix. The U.S. has some of the world's most stringent diesel emissions standards.

Complicating matters, it now appears that Volkswagen's 2016 diesels may be using a different type of software code to evade emissions mandates.

Thursday's order by German Transport Minister Alexander Dobrindt told VW "to remove the software from all vehicles and to take appropriate measures to ensure that the emissions rules are fulfilled."

The embattled automaker will have to provide German regulators with the code for a software

fix by the end of this month. Repairs aren't scheduled to begin until early in 2016.

The mandatory recall in Germany means other EU countries will follow suit. Europe's biggest carmaker has said up to 8 million vehicles in the EU could contain banned software.

Last week, Volkswagen AG CEO Matthias Mueller said he expected to begin the repair of the 11 million diesel vehicles in January, with a goal of completing the "retrofit" by the end of 2016. Along with changing the software code on VW's EA 189 engine, some versions, especially a smaller 1.6-liter diesel, could require revisions to the engine itself, not just an update to the engine controller's code.

A fix might take longer in the U.S.

For one thing, Volkswagen has to prove to the EPA that any changes will continue to meet emissions standards for 150,000 miles. And because the American standards for smog-causing oxides of nitrogen (NOx) and particulate emissions are tougher than in Europe, VW insiders have said they expect they will have to modify engine hardware, as well.

Further complicating the situation, there have been two major updates to the 2.0-liter U.S. diesel since it was introduced. Earlier models may now require the addition of a urea injection system similar to what most other automakers use on their diesel vehicles. The ammonia-like chemical helps break down NOx into harmless components.

VW Plans to Overhaul Diesel Technology in Scandal's Wake

Meanwhile, the EPA has begun examining the software used on 2016 versions of some diesels that Volkswagen use different software code also aimed at fooling emissions tests.

VW on Tuesday told the Associated Press the "auxiliary emissions control device" on 2016 models operates differently from the so-called "defeat device" used on VW diesels during the

previous seven years.

But so far VW but has provided regulators with few details.

"We have a long list of questions for VW about this," Janet McCabe, acting assistant EPA administrator for air quality, said this week. "We're getting some answers from them, but we do not have all the answers yet."

As a result of the disclosure, VW has withdrawn a request for the EPA to certify some of its 2016 diesel models for sale in the U.S. Whether the new software code actually violates U.S. emissions rules is unclear, however.

Toyota to Phase Out Gas-Powered Vehicles, Doubling Down on Hydrogen

If it does violate the rules, Volkswagen's problems could increase exponentially, some observers warn. The maker already faces potential fines from the EPA of more than $18 billion for the first software cheat. It is also facing a criminal investigation into the scandal by the U.S. Department of Justice. And at least a half-dozen class action lawsuits have now been filed on behalf of VW diesel owners.

Additional civil and criminal probes are underway abroad.

German Transport Minister Dobrindt said that while his agency had an "extraordinarily good" working relationship with VW as it continues its probe, for the moment, at least, it has "no information about who decided where, when at Volkswagen about the use of such software."

Since the diesel scam was revealed last month, VW has ousted its long-time CEO Martin Winterkorn, along with two of its top R&D executives. Meanwhile, Winfried Vahland, who was named just three weeks CEO of the new Volkswagen North America group tendered his resignation on Wednesday. The maker said that departure was "expressly not related" to the

diesel scandal, but provided no other details.

Reuters contributed to this report.

WIRED:

http://www.wired.com/2015/10/dozens-of-managers-were-involved-in-vws-diesel-scandal/

DOZENS OF MANAGERS WERE INVOLVED IN VW'S DIESEL SCANDAL

ALEX DAVIES GEAR DATE OF PUBLICATION: 10.14.15

AT LEAST 30 Volkswagen managers played a role in using software to cheat on emissions testing on more than 10 million diesel cars, Der Spiegel reports.

The German magazine is citing reports by Volkswagen, as well as by law firm Jones Day, and says the managers will likely be suspended. A VW spokesperson says "This number is without foundation.

Due to the ongoing investigation we will not reveal the number nor the names of possible persons concerned."

Meanwhile, VW's newly chosen head of North America, Winfried Vahland, is leaving the company just two weeks after being designated for the post. According to a Reuters report, Vahland, who's been running VW's Skoda brand, is leaving over differences of opinion with the Board.

This week, VW announced it plans to recover from the scandal by increasing its focus on electric cars, including plans for a plug-in hybrid Phaeton sedan.

Flemingsburg Gazette:

VW scandal: Nine out of 10 United Kingdom customers demand compensation

Brittany Kelley | 15 October 2015, 12:15

Volkswagen has disclosed to USA regulators that there is additional suspect software in its 2016 diesel models that would potentially help their exhaust systems run cleaner during government tests. A VW spokesman confirmed that the company reported the device last week to the Environmental Protection Agency, which discovered the initial defeat device that allowed the company to cheat emissions tests. As the reputation of "clean diesel" small-car engines gets tarnished by Volkswagen AG's massive diesel-emissions scandal, the world's top automaker appears to be taking electric cars more seriously.

VW spokeswoman Jeannine Ginivan said the new issue with the 2016 vehicles was first revealed last week to U.S. Environmental Protection Agency and California regulators. The software at situation makes a air pollution-management catalyst warmth up quicker, enhancing efficiency of the system that separates smog-inflicting nitrogen oxide into innocent nitrogen and oxygen gases. During the course of a media briefing on Tuesday, EPA Assistant Administrator Janet McCabe said that the VW diesel vehicles supposedly equipped with the automaker's new emission-control device have not yet been certified for sale by the EPA. EPA's McCabe wouldn't say if VW's failure to disclose the software in its 2016 applications was illegal.

Diesel variations of the Passat sedan manufactured on the firm's plant in Chattanooga, Tennessee, are also on maintain. Earlier this week Volkswagen's United Kingdom boss Paul Willis said it was "premature" to discuss compensation. Asked for additional detail, a VW spokesperson on Monday said the software "has the function of a warmup strategy which is subject to approval" by EPA. It would suggest a deliberate effort by the company to cheat US emissions tests, which continued even after regulators pressed the company about the irregular emissions produced by the older cars previous year. Volkswagen already faced an ongoing criminal inquiry and billions in fines.

The existence of the new software was made public last week by Volkswagen Group of America president and CEO Michael Horn in testimony he gave to a congressional subcommittee investigating the scandal. In another blow to the carmaker on Wednesday, the man Volkswagen lined up less than three weeks ago to head its North American business resigned. Meanwhile, the US Federal Trade Commission, which probes companies accused of deceptive advertising, has joined the EPA and the Justice Department in investigating Volkswagen.

In the wake of the scandal, 86% of VW drivers are concerned about the environmental impact of their auto, while 83% questioned the impact on its resale value and 73% feared the performance of their vehicle would be affected.

Burlington Free Press:

Vermonters sue over VW's emissions trickery

Dan D'Ambrosio, Free Press Staff Writer 10:19 a.m. EDT October 15, 2015

Two class-action lawsuits have been filed in Vermont against Volkswagen for cheating on emissions testing.

In 2013, Bob Turnau of Charlotte bought a sleek, white Volkswagen Jetta Sportwagen TDI that checked all the boxes for the environmentally and socially aware finance director at Resource in Burlington. The diesel-powered Jetta got great mileage and also met or exceeded all U.S. emission standards. And it had snappy acceleration.

"Around town I was getting 38 to 40 miles per gallon," Turnau said. "I made a big trip one year down South, it was over 50 miles per gallon. I really loved it for that.It was environmentally conscious, it had great fuel mileage and it was fun to drive. Those three things were really the troika of what led me to buy Volkswagen."

Then, in September it all fell apart when Volkswagen admitted to the U.S. Environmental Protection Agency and the California Air Resources Board that it had employed a sophisticated device to cheat U.S. emissions standards in diesel cars including the Audi A3, Beetle, Golf, Jetta and Passat.

"We take this matter very seriously," said Christopher Grundler, director of EPA's Office of Transportation and Air Quality in a press release in early October. "It's not only a violation of the Clean Air Act, it threatens public health and the credibility of the industry."

Boy, did it ever. Turnau, a resident of Charlotte, and thousands of his fellow Volkswagen owners across the country discovered their diesel-powered cars were only meeting emission standards when hooked up to testing equipment — the heart of the ploy implemented by sophisticated software — and they were spewing up to 40 times the allowed levels of nitrogen oxides when actually traveling down the road.

Turnau learned about the deception from news reports.

"It was complete disbelief," he said. "I bought a car that just wasn't what they told me it was."

Soon, disbelief turned to anger, and a determination not to be sidelined, waiting for Volkswagen to respond. Turnau called his friend, Tris Coffin, former U.S. Attorney for Vermont, now working in the private sector for Downs Rachlin Martin, PLLC in Burlington.

Lots of angry Vermonters

Turnau is the lead plaintiff in a class-action lawsuit brought by DRM against Volkswagen of America and its parent company, Volkswagen AG of Germany. Members of the class include all Vermonters who bought or owned diesel-powered Volkswagen Jetta, Golf, Passat or Audi A3 automobiles with model years from 2008 to present.

The lawsuit alleges buyers paid a higher price for the vehicles as compared to gasoline powered cars, in part because of company claims about lower emissions. Additionally, the value of the cars is lower because of the deception, and owners face unknown challenges in bringing the cars into compliance with federal regulations.

Turnau bought his Jetta based on Volkswagen's representations that it was an environmentally friendly, "emissions meeting or beating" car, which turned out to be a lie.

"One of the ways you can recover from that is by bringing a lawsuit," Coffin said.

Turnau agrees.

"I feel that this suit gives me a voice in what the outcome could be," he said.

Coffin said Tuesday that five more Vermonters have joined the lawsuit, including Chuck Lacy, former president and COO of Ben & Jerry's. Nearly 400 people have expressed interest in the lawsuit, he said.

Another class action lawsuit has been filed in Vermont by attorney Patrick Bernal of Witten, Woolmington, Campbell & Bernal, P.C. in Manchester Center. Bernal's lawsuit has two lead plaintiffs, and Bernal said he has been contacted by "scores" more Volkswagen owners in Vermont.

"In my view Volkswagen did a terrible thing and it did it to lots of different people," Bernal said. "I represent a lot of angry Vermonters who feel absolutely betrayed."

The Lance Armstrong of automakers?

Across Vermont, there are about 3,000 affected Volkswagen owners, according to Tris Coffin. That makes Vermont one of the most affected states, per capita, said Attorney General Bill Sorrell, who announced an investigation into the diesel debacle on Sept. 24.

Sorrell said there are several potential issues. Has there been a violation of Vermont's consumer protection act for unfair or deceptive actions in commerce, as the Downs, Rachlin Martin lawsuit alleges? If found guilty, Volkswagen would be liable for triple damages. Has Volkswagen been selling vehicles in Vermont that violate the state's auto emission standards? Vermont has collected millions of dollars in penalties in other such cases alleging environmental violations and consumer fraud.

"We seek to recover monies on behalf of Vermonters who have been scammed, so we've got those issues of trying to see that Vermonters who bought those vehicles, including one of my sisters, are made whole from the losses they've suffered," Sorrell said.

Rep. Peter Welch has also been on the Volkswagen case, grilling the company's U.S. CEO Michael Horn in a House committee hearing last week. Before the hearing, Welch asked for questions and comments from Vermonters on his Facebook page.

"My fear is that VW is the Lance Armstrong of the car industry and they were just the first to be caught," said Shara Tarule.

"Just give me some cash and a new Audi," said Marshall Pierce.

"Fix it, just fix it," implored Kit Burns Wheatley.

"It's so outrageous what Volkswagen did that's it's hard to believe they did it," said Welch in an interview on Tuesday. "It took self-conscious planning and careful execution to install this software that would defeat the testing. There's a part of everybody who learned about this that

was just flabbergasted. Why would a company do that? How did they think they would get away with it?"

No write-offs

One of the comments Welch got from his constituents concerned the potential for Volkswagen to write off part of the federal penalties that might result from the company's actions, which could run into the billions of dollars. Forbes reported last week that in a potential out-of-court settlement regarding the Gulf oil spill, BP would be able to write off $15.3 billion of a $20.8 billion penalty. Only $5.5 billion would be designated as a non-tax-deductible Clean Water Act penalty.

Welch asked Horn in the hearing whether he would agree that Volkswagen wouldn't take advantage of the tax code to shift some of the burden of any penalties to taxpayers.

"He said he didn't know what the law was, but he didn't think taxpayers should share in the burden," Welch said. "That sent a signal to Volkswagen headquarters that not only is this a problem, but it's a real problem."

Welch has introduced a bill, "The Stop Deducting Damages Act of 2015 (H.R. 2456)" that would close the loophole that allows companies like BP to shift some of the burden of their fines to taxpayers. The bill has been referred to House Ways and Means.

Welch also spoke to Bill Shearer, owner of Shearer Volkswagen in South Burlington, to get an idea of the impact the diesel debacle has had on dealers. Welch sympathizes with Shearer, whom he points out had nothing to do with the disastrous decisions that led to the deceit perpetrated on Volkswagen customers.

"Our dealers have relationships with their customers, they tend to be family businesses," Welch said. "He's going to have a hit in his sales and obviously this will affect his bottom line. He's going to keep his trusted and valued employees on, that's what he told me."

Round up the bad guys

Shearer confirmed he was not planning any layoffs. He owns five dealerships, including Volkswagen, GM, Honda, Acura and Audi, with a total of 200 employees. Four of the dealerships are in the Burlington area and one is in Rutland. Shearer said Volkswagen represents 30 percent of his new car sales.

"It's a terrible thing for our customers and for the employees and families that have a big stake in Volkswagen," Shearer said. "I feel terrible for those people, but we'll make it work. We've been through GM bankruptcy and other recalls."

Something went awry at Volkswagen, Shearer said, but he's confident the German company will pull through in the end.

"It's a quality company and something bad happened," he said. "They're going to pick it apart and see who did what. I know these people. I know Michael Horn. They're determined to fix it for every customer. I'm determined to be part of that happening."

Once Volkswagen determines who did what, those people should be fired, said Matthew Dodds of Brandthropology, a marketing firm in Burlington. Martin Winterkorn, CEO since 2007, resigned in September, saying he was not aware of any wrongdoing on his part.

"They got to terminate everybody who either approved or turned a blind eye to what happened," Dodds said. "You have to excise that part of the culture that allowed that to happen. If you don't do that I don't believe it's credible."

That task falls to the new CEO, Matthias Müller, according to Dodds.

"It has to come out of the voice of the new sheriff in town, he has to round up the bad guys," Dodds said.

Second, Volkswagen has to make its customers whole, no matter the cost.

"Take it on the chin and take care of your customer base," Dodds said. "Give until it hurts. Make it painful for yourself because here's the deal: People in love with the brand will reward you with loyalty."

Michael Jager of Solidarity of Unbridled Labour in Burlington, agrees with Dodds that Volkswagen must pay until it hurts. But he worries that the damage goes much deeper than angry customers who must be made whole. He said the "amplified perception" of German engineering, embodying precision and quality, makes the deceit even worse, calling the company's entire culture into question.

"The way they calculatedly did this, to create this lie, takes German engineering and design prowess and amplifies it in the opposite direction," Jager said.

To reverse the damage is going to take an unprecedented response, Jager said.

"Could you imagine something as bold as giving people their money back, taking back the cars, repairing them and giving them to car shares across the country?" he said. "With a move like that, they might win back their customers."

Subject: Re: Latest agenda and logistics of Sino-US workshop

Dear Jim,
Thank you for your feedback. I'll pass along these to VECC this evening for them to decide and make the changes accordingly. At this stage, they're in complete control of the agenda.

Meeting in the morning of Oct 21 sounds good! If you're interested in having breakfast together, I (and Drew) will be in breakfast area around 7:30am.

One more thing is that I mentioned to you last time, we've translated the EPA Compliance Report 2009-2011 because VECC thought that would be useful. I understand your team is too busy to proof read the translation. I'll share our translation with VECC and add a note saying: "The translation is provided by ICCT and not approved by EPA, and should not be considered as official translation. All information is subject to EPA's interpretation". I think VECC was planning to print it out and share with a small group of people (MEP officials), but not to share with the general audience at the workshop. Basically VECC will determine how to use the material.

Please let me know if this is ok with you.

Have a safe and good trip. Look forward to seeing you in Beijing!

Dear Hui,

Thank you for sending along the latest agenda and logistics for the workshop. We are looking forward to working with you, and our MEP counterparts to make this Workshop a success. I noted two items on the agenda that need updated:

1) Part IV: The presentation on the U.S. Clean Diesel Legacy Fleet Program will be delivered by myself. Please delete the TBD note.

2) As we discussed during our conference call a few weeks ago, we are happy to host one of the sessions during the workshop but we believe that VECC or even ICCT should take on a leadership role and host one, or more of the others. Please update the agenda to include EPA as only the host of Part II.

Finally, as you know from the time we land in Beijing the EPA team will be extremely busy throughout the week. Unfortunately we will not be able to attend the speakers welcome dinner on the evening of Tuesday, October 20th. We currently have other meetings scheduled for that time. We will plan to catch-up with you in the morning of Wednesday, October 21st, prior to the start of the Workshop. We look forward to seeing you next week in Beijing.

Thanks again for all your hard work in planning and preparing for the workshop.

Dear speakers,

Please find the attached latest agenda of the workshop and a logistics memo. I checked in with VECC-MEP a couple of hours ago, there is still one unconfirmed speaker from China side. So this version is still not final final, but that should not affect your presentations.

Later, I'll send to each speaker his/her final bilingual slides, and specific airport pick up information (if applicable).

Best,

Hui

Volkswagen to Recall 8.5 Million Vehicles in Europe

By MELISSA EDDYOCT. 15, 2015

BERLIN — Germany's automobile regulator on Thursday ordered Volkswagen to recall 2.4 million rigged diesel vehicles in the country, prompting the company later in the day to announce an even bigger recall — of 8.5 million of its diesel cars in Europe.

Volkswagen has been indicating for weeks that it intends to fix the cars it has admitted to deliberately equipping with software meant to cheat on emissions tests. But it wasn't until Thursday, and only after the German government ordered a recall on the grounds that the company's plans so far were insufficient, that the carmaker publicly committed to a program and a timetable.

Volkswagen, indicating that it would adopt the German order Europewide, said it would begin recalling and repairing the cars in January in an effort it expected would stretch beyond the end of 2016.

The company has still not said how it will fix the cars, but the German authorities have set the end of next month as a deadline for spelling out the technical details of the remedy.

Graphic: How Volkswagen Got Away With Diesel Deception

In the United States, where Volkswagen's deception was discovered and was disclosed by the Environmental Protection Agency in September, the E.P.A. has said it plans to order a recall — but it has not yet done so.

"E.P.A. will order a recall once the agency has done testing to confirm that Volkswagen's proposed fix will be effective,'' an agency spokeswoman, Laura Allen, said in an email on Thursday. "E.P.A. will conduct our own testing to confirm this. Then we will order a recall.''

Volkswagen officials have indicated that repairing the nearly half-million cars affected in the United States might require a more extensive solution because American standards on nitrogen oxide emissions are tougher than those in the European Union.

Germany's is the first government-ordered recall anywhere since Volkswagen admitted the deception last month. The government said it was rejecting the automaker's previous proposal to repair the vehicles as insufficient.

Germany's transportation minister, Alexander Dobrindt, said on Wednesday that the mandatory recall would be overseen by the country's automobile regulator, the Federal Motor Transport Authority, known by its German initials K.B.A.

"The K.B.A. believes that the software used in the diesel engines constitutes an illegal defeat device," Mr. Dobrindt said. "The authority has demanded that Volkswagen remove the software and take all steps necessary to ensure that the emissions regulations are met."

Carl Tobias, a law professor at the University of Richmond, in Virginia, who has studied auto safety issues, said the K.B.A.'s recall was a positive development.

"Rather than a proposal, generated by Volkswagen and subject to what they want to do, an authority is now in charge and will dictate what happens," Mr. Tobias said in a telephone interview.

But, "it still depends on how rigorous the authority will be with Volkswagen," Mr. Tobias said. "V.W. has always been very cautious in terms of the timeline, and we won't know for some time."

The crackdown by the German government dealt a blow to the company in one of its most important markets. But Volkswagen's stock rose in morning trading in Frankfurt, despite the recall order.

It was only after the company announced that it would expand the recall to 8.5 million cars across Europe that investors evidently absorbed the sobering scope of the automaker's task. The shares ended the day in Germany down 3.2 percent, having lost more than a quarter of their value since the deception was disclosed on Sept. 18.

"The Federal Motor Transport Authority's decision has created the possibility to proceed with a joint and concerted action across all of the European Union," Matthias Müller, Volkswagen's new chief executive, wrote in a letter on Thursday to Mr. Dobrindt.

The company's decision to announce a broader European recall came as representatives of the K.B.A. and other national authorities were meeting in Brussels to brief the European Commission on investigations into the scandal in their markets. Austria's Transportation Ministry said on Thursday that all Volkswagens with affected engines would be recalled in his country.

Mr. Müller said Volkswagen would provide the German regulator with a plan for the "technical implementation" of the necessary fixes by the end of November.

While vehicles with 1.2- and 2-liter engines appeared to need only replacement software to bring them back into compliance, the 1.6-liter models would most likely require additional hardware to remedy the problem, and such hardware would not be ready until next September, Mr. Dobrindt said.

But he expressed confidence that Volkswagen would be able to meet the authority's demands. "We have the impression that Volkswagen is technically capable of carrying out the technically necessary measures," Mr. Dobrindt said.

Volkswagen said on Thursday that it would directly contact and inform customers who have vehicles with an affected engine, pointing to a website set up this month where customers could enter a vehicle's identification number to check whether it would be part of the recall.

Volkswagen holds near mythical status in the world of German business and is deeply entwined with the emotions of post-World War II recovery.

The company is governed through a unique structure, involving a hybrid of control by members of the Porsche and Piëch families, the state government of Lower Saxony and labor representatives.

In the past, Volkswagen has been dominated by strong personalities with a top-down style of decision-making that some critics have said may have contributed to mistakes that led to the scandal.

At a meeting with top managers in Leipzig on Thursday, Mr. Müller signaled a break with that style of management, saying that future decision-making would be less centralized and that Volkswagen's divisional managers would have more autonomy.

"Volkswagen is not a one-man show," Mr. Müller said in an address.

"It is definitely not my intention to intervene in decisions about products," Mr. Müller said, in what appeared to be a clear break with the obsession of his predecessor, Martin Winterkorn, to be involved in the minutest details of product development. "Whether a windshield sits at a one-degree angle higher or not, I'm not going to concern myself with that."

This week, Volkswagen said it would develop electric vehicles, an offering the company has been slow to adopt, despite a pledge by the German government to get a million electric cars on the road by 2020.

Barbara Hendricks, the German minister for the environment, said in comments to ZDF public television early Thursday that the government should consider scrapping tax subsidies for diesel, shifting them instead to electric vehicles to encourage more environmentally friendly technology.

But she later backtracked, issuing a statement in which she warned against "demonizing" diesel technology, a warning that was also sounded by Mr. Dobrindt. According to a study by Roland Berger consultants, more than 50 percent of all new passenger cars sold in Europe run on diesel, which is favored for its fuel economy, despite its higher emission of pollutants.

U.S. Pursues Several Paths in Volkswagen Probe

Investigators expand review, evaluating pollution rules, official statements and consumer claims

By ARUNA VISWANATHA And MIKE SPECTOR

Oct. 15, 2015

The U.S. attorney's office in Detroit and the Justice Department's Fraud Section joined a

sweeping federal probe of Volkswagen AG over emissions-test cheating, according to people familiar with the matter, signaling the government's intent to cast a broad net and explore numerous paths to a possible criminal case.

The number of federal offices now involved in the Volkswagen case suggests an investigation could target the German auto maker and its employees for alleged offenses ranging from pollution to misleading government officials to claims made to consumers. The Federal Trade Commission, which investigates fraudulent advertising, confirmed its involvement, suggesting a focus on potentially misleading claims regarding the emissions.

A Volkswagen spokeswoman wouldn't comment on developments in the probe, saying only that the auto maker is cooperating with all official inquiries. Justice Department representatives also declined to comment.

The involvement of the U.S. attorney in Detroit, Barbara McQuade, signals her office may take a significant role in what is expected to be a major case. Ms. McQuade has a reputation as an aggressive prosecutor, having won a corruption case against former Detroit Mayor Kwame Kilpatrick. In sprawling investigations like the Volkswagen probe, the Justice Department has a choice of which prosecutor to assign.

David Uhlmann, formerly a top environmental crimes prosecutor who is now a law professor at the University of Michigan, said the number of government offices involved suggested the case would be "of national significance," with any settlement likely to reach into the billions of dollars.

The federal investigation now includes the Detroit office of the Federal Bureau of Investigation and the Justice Department's Environment and Natural Resources Division, which investigated BP PLC after the Deepwater Horizon oil spill, people familiar with the probe said. The Environmental Protection Agency, which in September disclosed the auto maker's cheating, could hit Volkswagen with more than $18 billion in fines based on the number of vehicles involved, though it isn't clear whether the agency will pursue such a large penalty.

The Volkswagen investigation is centered on the auto maker's use of software designed to dupe U.S. emissions tests on nearly 500,000 diesel-powered cars. Volkswagen, which has U.S. offices

in Auburn Hills, Mich., has admitted to using the software, known as a defeat device, to make cars in model years 2009 to 2015 appear cleaner in tests than they were during normal driving conditions.

Volkswagen has set aside $7.3 billion to deal with the fallout, a figure the company's new chief executive has said he expects to rise.

Europe's largest auto maker faces not only aggressive investigations by European and U.S. authorities, but also class-action lawsuits from aggrieved customers. Prosecutors in Germany earlier this month raided Volkswagen offices and private homes as part of a criminal inquiry there.

The EPA alleged last month that Volkswagen had violated two parts of the U.S. Clean Air Act. That law exempts auto makers from criminal penalties for illegal pollution, but it does criminalize the conveying of false information to regulators.

"You can't criminally prosecute auto makers for using the defeat device under the Clean Air Act," said John Walke, a senior attorney at the National Resources Defense Council, an environmental group. "But you can prosecute them for the result of using the defeat device, which is making a false representation to EPA—assuming the facts bear that out."

Federal prosecutors have recently turned to other laws to charge auto makers with crimes. The Justice Department charged General Motors Co. and Toyota Motor Corp. with wire fraud for concealing information on safety defects. In the GM case, prosecutors also used a section of the U.S. code that can hold companies broadly accountable for misleading government officials. GM and Toyota accepted deferred prosecution agreements under which they agreed to pay large sums to the U.S. and retain independent consultants to assess their practices.

The addition of the Detroit U.S. attorney's office to the Volkswagen probe underscores the sometimes vigorous jockeying among federal prosecutors over high-profile cases. The nation's 93 U.S. Attorney's offices handle federal crime in their districts, but many cases involve multiple locales and several prosecutors may try to claim them.

U.S. auto makers are based in Detroit, and some foreign car companies have offices there as well. The EPA has emissions testing facilities in Ann Arbor, Mich., which along with Volkswagen's area offices falls within Ms. McQuade's jurisdiction.

The Fraud Section, which has handled several of the biggest financial fraud cases in the past few years, often coordinates with U.S. attorneys' offices in high-profile cases.

Still, federal prosecutors in Manhattan, arguably the nation's highest-profile U.S. attorney's office, handled the criminal cases against Toyota and GM. Currently, Ms. McQuade's office is conducting a continuing criminal probe of Japan's Takata Corp. over rupture-prone air bags, after the case began with New York federal prosecutors. Takata has said it is cooperating with investigations.

Ms. McQuade, a Detroit native who took over the office in 2010, appears to be carving out a major role for her office in the Volkswagen probe. She previously has sought out large, complex cases since taking over the Detroit office, moving it away from drug crimes and other matters that can be handled by state prosecutors, according to former colleagues.

"A hallmark of her tenure is a shift from the reactive, smaller, arrest-generated cases that overlap with state law, and a focus more on larger, multi-jurisdictional, largely white-collar cases," said Timothy Heaphy, a former U.S. Attorney in Virginia. Mr. Heaphy has worked with Ms. McQuade on a panel of federal prosecutors that advises the U.S. attorney general.

Ms. McQuade's office won high-profile convictions of Mr. Kilpatrick on corruption charges and former Ford Motor Co. and GM engineers accused of stealing trade secrets for Chinese competitors.

Her office has also prosecuted major health care fraud cases, including one involving a Detroit-area doctor who was sentenced in July to 45 years in prison for bilking Medicare and private insurers of $34 million.

Ms. McQuade attended the University of Michigan and worked as a prosecutor in the Detroit office for 12 years before being nominated to the top post. Her family has a long history with the auto industry in Detroit, and she has said her parents met when they worked together at GM.

Volkswagen recalls 8.5 million 'clean diesel' vehicles in Europe

By KYLE FELDSCHER

Volkswagen will recall 8.5 million "clean diesel" vehicles in Europe because of software that allows the vehicles to cheat emissions tests, the German automaker announced Thursday morning.

The recall does not include the approximately 482,000 similar vehicles in the United States that have been identified by the Environmental Protection Agency and the California Air Resources Board as containing the same "defeat device" software.

According to a statement from Volkswagen, the recall involves 2.4 million vehicles in Germany and 8.5 million across Europe. Outside of the 28 European Union countries involved in the recall, it will be up to each individual country to work with the company to come up with its own plan for a recall.

"Work on the technical solutions detailed in the plan of measures is currently proceeding at full speed. Remedial action on the vehicles will begin in January 2016 — at no cost to our customers," the company said. "The technical solutions can involve software as well as hardware measures. These are currently being developed for each affected series and each affected model year."

The EPA and the California Air Resources Board are investigating Volkswagen for installing "defeat devices" that allow vehicles to skirt emissions tests. The devices allowed popular models, such as the Jetta, to tell when they were undergoing emissions testing.

The defeat device is about 100 million lines of software code written into the vehicle's programming.

The software could tell if a test was taking place based on the position of the vehicle's steering wheel, the speed the vehicle was traveling, how long the engine was being used and barometric pressure, according to the EPA. The vehicles would reduce emissions of nitrogen oxide during testing and then spew 40 times the legal limit during normal use.

Volkswagen officials are blaming "rogue software engineers" for the devices.

Two congressional committees are investigating the scam with law enforcement authorities in Germany.

The recall in Europe gives some clues to how a similar recall may work in the United States when it eventually comes about.

European VW owners are currently able to look up whether their vehicle contains a defeat device on the company's website. The company says it will also tell the owners of the affected vehicles over the next weeks and months what measures will have to be taken to fix their vehicles.

The company emphasized, as has the EPA, all of the vehicles are safe to drive and can stay on the road.

Europe's love affair with diesel cars has been a disaster

Updated by Brad Plumer on October 15, 2015, 1:00 p.m. ET @bradplumer brad@vox.com

The recent news that Volkswagen had been illegally rigging its diesel-powered cars to cheat on pollution tests has sparked plenty of outrage. Hearings, lawsuits, fines, general opprobrium. And rightly so; the company's deception was appalling.

But there's a much broader, far more consequential problem here that a lot of coverage has danced around or hinted at only indirectly. So let's say it: Europe's longtime promotion of diesel vehicles as a "green" transportation option has been a complete and total disaster — for reasons that go well beyond the Volkswagen scandal.

Ever since the 1990s, European governments have been encouraging drivers to buy diesel cars as an alternative to traditional gasoline-powered vehicles. The rationale was simple: Diesel engines use fuel more efficiently, so the switch was supposed to reduce carbon dioxide emissions and help stave off global warming. Thanks to tax breaks and other incentives, diesel cars now make

up one-third of Europe's fleet, whereas they're a sideshow in the US and Japan:

Europe's diesel push might have seemed sensible once upon a time. But 20 years later, with the benefit of hindsight, it looks like a huge mistake, an impotent climate policy that had all sorts of unintended consequences.

The biggest drawback of diesel cars is that they emit higher levels of other harmful air pollutants like particulates and nitrogen oxides. And those ended up being far harder to clean up than experts initially predicted. We now know that Europe's regulators have failed spectacularly to control diesel pollution, relying on weak rules and flimsy testing procedures. Lots and lots of automakers — not just Volkswagen — have been manufacturing diesel cars that emit far more gunk than they're supposed to. As a result, cities like London and Paris are clogged with dangerously high levels of air pollution, causing thousands of premature deaths each year.

And that's not the worst part. It's now looking like Europe's diesel push didn't even do anything to help global warming, as one 2013 study by Michel Cames and Eckard Helmers found. The CO2 benefits from switching to diesel cars were overrated and offset by the extra soot their engines produced. Plus, Europe's entrenched diesel industry has impeded progress on more promising hybrid and electric car technologies that could've provide deeper emissions cuts.

The whole episode is a sobering case study in how well-intentioned green industrial policy can go horribly wrong. So let's roll the tape and see what lessons we can learn from Europe's decades-long diesel fiasco.

Why Europe embraced diesel cars in the 1980s and '90s

Tributes And Reaction To Paris Terror Attacks After Gunmen Kill 17 People

(David Ramos/Getty Images)

After crude oil gets pumped out of the ground, it's sent to refineries to be turned into usable fuel. Those refineries typically distill the oil into lighter and heavier components. The lightest stuff includes gasoline. On the heavier side is diesel fuel, which contains more energy per gallon.

For most of the 20th century, automakers largely designed cars to run on gasoline, which was more flammable and combusted easily using sparks. Engines that could combust diesel fuel, using air compression, had been invented in the 19th century, but they were noisier and belched more smoke, so they were mostly confined to large ships and trucks. Diesel was often used instead for heating and producing electricity.

But starting in the 1980s, French and German automakers began showing more interest in developing diesel-powered cars. The reasons have always been a little murky, although Cames and Helmers suggest it traces back to the OPEC oil crises of the 1970s. After global crude prices spiked, France decided to swear off using diesel for electricity and built a bunch of nuclear plants instead. Germany, meanwhile, switched from oil to natural gas for heating. When the crisis finally subsided, Europe's refiners were still producing lots of diesel with no buyers. So governments began urging automakers like Peugeot to look into diesel-powered vehicles.

By the late 1990s, diesel technology had improved dramatically, thanks to advances in fuel injection — common rail, especially — that allowed the engines to run more quietly. The newer diesel engines were a technical marvel, operating more efficiently than their gasoline counterparts and using less fuel per mile traveled (and, hence, emitting less carbon dioxide per mile). All they needed was a market.

Rising concern over global warming provided that push. In 1997, the European Union signed the Kyoto Protocol and committed to cutting its heat-trapping carbon dioxide emissions roughly 8 percent by 2012. The next year, the EU reached a landmark agreement with the continent's car manufacturers on reducing CO2.

At the time, there were lots of different paths Europe's automakers could have taken to green itself. They could've pursued direct injection technology for gasoline vehicles, making those engines more fuel-efficient. They could've ramped up R&D of hybrid electric car technology, as Japanese automakers like Toyota were starting to do. But European companies like Peugeot and Volkswagen and BMW had already been making big investments in diesel, and they wanted a climate policy that would allow those bets to pay off.

Europe's policymakers obliged. The EU agreed to a voluntary CO2 target for vehicles that was basically in line with what diesel technology would be able to meet. As researcher Sarah Keay-

Bright later noted, these standards were explicitly crafted so as not to force Europe's automakers to develop hybrids, electric vehicles, or other more advanced power trains.

Soon thereafter, European nations — including Britain, France, Germany, Italy, Spain, and Austria — began cutting taxes on diesel fuel and diesel car purchases to promote sales, all in the name of thwarting climate change. Diesel sales soared. Back in 1990, just 10 percent of new car registrations in Europe had run on diesel. By 2011, that had climbed to nearly 60 percent.

Today, Europe's diesel cars are a public health nightmare

Diesel engines do have one big pitfall. They may be more fuel-efficient and emit less CO2, but their engines tend to emit higher levels of other nasty air pollutants, including soot, particulates, and nitrogen oxides (NOx). Heavy exposure to these air pollutants can exacerbate heart and lung disease, trigger asthma attacks, and even cause premature death.

Everyone knew this back in the 1990s. Europe's regulators simply considered the trade-off acceptable. "At the time, the prevailing belief was that climate change was the really hard problem and should be the priority, whereas we'd had experience improving air quality, so everyone assumed we could easily fix that issue later," explains Martin Williams, an air pollution researcher at King's College London who previously worked for Britain's environmental agency.

That assumption turned out to be wrong. When European regulators later moved to clamp down on NOx and other conventional air pollution from diesel vehicles, they failed miserably.

Starting in 2000, the EU began ratcheting down the legal limits for NOx emissions (though Europe's diesel cars have always been allowed to emit NOx at a relatively higher rate than gasoline-powered cars). New vehicles were tested in laboratories, where cars were placed on giant treadmills, spun through a few exercises, and measured for pollution.

Trouble was, these tests turned out to be incredibly flimsy and easily gamed, explains John German of the International Council on Clean Transportation. Automakers could send cars to labs that were optimized for testing: stripped of excess weight, with the air conditioning turned

off, and so on. The test cars complied with the pollution limits just fine. But the cars that were actually being sold to consumers were quite different, with much higher emissions. (German says this sort of subtle gaming was technically legal, unlike Volkswagen's more elaborate deception, which involved illegal software that only turned pollution controls on during tests. Still, even if Volkswagen was the most flagrant cheater, it was hardly unique.)

Few realized the EU's pollution tests were badly flawed until 2010, when researchers started studying emissions from vehicles that were actually on the road. In one study, Williams set up roadside infrared detectors to measure NOx pollution from cars in seven British cities. What he found was shocking: Europe's newest diesel cars were emitting roughly as much NOx as older diesel cars from the 1990s.

In other words, 20 years of increasingly strict air pollution regulations had done absolutely nothing to reduce pollution. "That was the most surprising part," Williams says.

By that point, the damage had been done. Today, Paris occasionally jousts with Beijing for the title of world's most polluted city. London is grappling with unsafe levels of nitrogen dioxide. Germany, Austria, and Ireland have NOx pollution well above the legal limits.

And the health toll has been staggering. One recent study found that diesel pollution from cars, buses, and trucks in Britain caused 9,400 premature deaths in 2010 alone. It's difficult to suss out what fraction of those deaths might have been avoided if emission rules had been properly enforced all along, but that gives some sense of the brutal cost here.

To be fair, European regulators have scrambled to improve the tests now that they've realized what was happening. But it's still unclear whether the diesel car industry can ever clean up its act.

Starting in 2014, the newest, most stringent emissions standard — known as Euro 6 — will require diesel cars to emit no more than 0.08 grams of NOx per kilometer, an 84 percent reduction from 2000-era levels. Europe's regulators will also start requiring on-road testing in addition to laboratory checkups. (That's what the United States EPA does, and it should eliminate most gaming, although, as the Volkswagen scandal showed, truly determined cheaters are hard to detect.)

But here's the fat asterisk: Now that they can no longer easily game the system, Europe's automakers are lobbying hard to relax the pollution standards. That's because it's not very easy to cut NOx pollution from diesel cars. One of the technologies that could meet the most stringent limits, known as selective catalytic reduction, involves running the car's exhaust through a honeycombed chamber that sprays urea and water, which breaks the NOx down into harmless nitrogen, oxygen, and water molecules. But these devices can add about $5,000 to $8,000 to the price of a vehicle, which would make many small cars uneconomical. They can also negatively affect fuel economy, torque, and other aspects of the car's performance.

So the jury's still out on whether "clean diesel" cars will even be viable in practice. Volkswagen had claimed to have cracked the problem with its most recent diesel models ... except we now know the company was doing it by rigging the cars with software to evade pollution tests.

The grim irony: Europe's diesel push hasn't helped with global warming

If Europe's diesel surge had helped mitigate climate change, then maybe (just maybe) you could argue that all this extra air pollution was worth it. Except here's the grim plot twist: The climate benefits appear to have been negligible.

In their 2013 paper, Cames and Helmers argued that Europe is probably worse off today, from a global warming perspective, than it would have been if automakers had just focused on improving gasoline-powered cars all along. And Europe is arguably much worse off than it would have been if automakers had started investing in hybrid electric technology back in the 1990s.

The authors offer up this chart, showing that Europe's diesel cars may have once had a sizable CO2 advantage over traditional gasoline vehicles. But today that gap has virtually disappeared, as new technologies like turbochargers have made gasoline engines nearly as efficient as diesel cars:

What's more, there are two subtle drawbacks to diesel engines that make them worse for global

warming than they seem.

First, even if diesel cars emit less CO2 than gasoline vehicles, they emit a lot more black carbon, or soot, a pollutant that (we've recently learned) also contributes significantly to global warming. The precise accounting here is still subject to some dispute, but Cames and Helmers point out that black carbon emissions from diesel cars likely negate a big chunk of their CO2 advantage.

Second, remember that European countries encouraged diesel car adoption by slashing taxes on the diesel fuel itself (compared with gasoline). But as any Econ 101 student will tell you, cutting fuel prices gives people an incentive to drive more miles — and increase their overall emissions. This further chips away at any climate advantage diesel might have.

Add it up, and Cames and Helmers conclude that "the European diesel car boom did not cool down the atmosphere."

One final coda here. Go back and look at the Japanese cars on the graph above. Back in the late 1990s, Japanese automakers were also thinking about cutting CO2, but they figured that diesel was a dead-end technology, since the cost of cleaning up the extra NOx pollution would be too high. Instead, companies like Toyota started investing in hybrid vehicles, with the first Prius appearing in 1997. By contrast, Europe's automakers initially scoffed at electric powertrains, and none of them even bothered producing hybrids until Mercedes finally rolled one out in 2009.

Japan's decision now looks prescient, and Europe's looks shortsighted. Hybrids proved much greener: The newest Japanese cars now produce roughly 10 percent less CO2 per mile than Europe's diesel vehicles do, on average. And Japan's automakers appear to be better set up for the future. Many experts now think that transportation will eventually have to become electrified if we want truly deep reductions in emissions. But European automakers, stuck on diesel for so long, are scrambling to catch up.

Europe is now struggling to undo its diesel mistake — but it's not easy

Debate Over Vehicle Emissions Intensifies As Volkswagen Scandal Widens

Because of the Volkswagen scandal, and the staggering levels of pollution in cities like Paris and London, Europe's policymakers are now beginning to rethink their fondness for diesel cars. But it's a hard technology to give up. Path dependency is a hell of a drug.

In diesel-loving France, Ségolène Royal, the environment minister, recently said that the country would consider phasing out preferential tax breaks for diesel over the next five years. "We need to start preparing our move out of diesel," she reportedly told France 5 television. But she's also bristled at any suggestion that France should act too quickly. After all, diesel cars still account for more than 60 percent of all European sales for Renault and Peugeot, two major local manufacturers. They can't just unwind those positions overnight.

Volkswagen, for its part, is also engaged in a bit of soul searching around diesel (at least, when it's not recalling its 11 million law-breaking diesel cars and dealing with criminal investigations). The company recently announced that it would take a major plunge into electric powertrains, creating a standardized architecture for a new wave of plug-in cars. "The Volkswagen brand is repositioning itself for the future," said executive Herbert Diess. Except, of course, this shift won't happen overnight. Because VW spent so many years dreaming up ways to evade regulators and sell diesel cars, it's now playing catch-up to electric car companies like Tesla.

In the meantime, Europe's smoggy cities still have to grapple with the fallout from all those polluting diesel cars that are still on the road — and will likely stick around for years. The EU has started to pressure countries with the worst air pollution. Cities like London, Stockholm, and Milan are already experimenting with emission-free zones. In the future, drivers with old diesel clunkers could have to pay extra to travel downtown in certain cities. But even this cleanup will take years.

Energy bets can sometimes go horribly wrong. So how do we avoid that?

Europe's misadventure with diesel cars is a great case study in how energy policy can go very badly awry, and no doubt there's a long list of lessons to draw. I'll just mention a few big ones:

First, Europe's complete failure to regulate diesel pollution is worth studying. Not only had regulators designed flimsy emissions tests — partly at the behest of industry lobbying — but it

took two decades to even realize the tests were failing. Crafting ambitious environmental rules is all well and good, but without ample enforcement and monitoring, those rules are basically pointless. (Note that China is now pursuing ambitious climate policies of its own, but experts keep muttering that enforcement will be a big challenge — a caveat that deserves much more attention.)

Another possible takeaway is that if we really want to reduce greenhouse gas emissions from the transportation sector, liquid fuels are ultimately a dead end and electrification is the best path forward. There's no shortage of experts who believe that, and certainly that's the lesson Volkswagen seems to be drawing from this fiasco. That said, it's worth noting that Toyota, which was ahead of the pack in developing hybrid electrics in the late 1990s, actually doesn't believe electric cars are the future and is pouring R&D into hydrogen cars instead.

Which brings us to the third takeaway. The future is hard to predict. Diesel cars seemed like a reasonable idea in the 1990s and a disaster today. That suggests that policymakers should have a lot more humility when crafting energy policy. One approach might be to pursue more technology-neutral policies organized around preferred outcomes — say, tightly enforced standards that require lower emissions — rather than favoring specific industries just because they happen to seem promising at that moment in time.

This issue comes up again and again. For years, governments have been laying down big bets on emerging clean energy technologies. France did it with nuclear power in the 1970s and '80s. Germany did it with wind and solar power in the 2000s, through feed-in tariffs. The United States did it with corn ethanol in 2005.

Done right, this sort of government support can be valuable, helping useful new energy options break into the mainstream against entrenched competition. But the biggest risk is that governments end up gambling on badly flawed technologies that then become the entrenched competition and prove impossible to get rid of. The US arguably made that mistake with corn ethanol, which has had unintended ripple effects on the food supply and deforestation and is proving politically difficult to wind down. Now it's clear that Europe made that mistake, too.

Let the Recalls Begin: Germany Tells VW to Fix 2.4 Million Diesels

by PAUL A. EISENSTEIN

About 2.4 million Volkswagen diesels sold in Germany over the last seven years will be recalled under an order issued Thursday by the Berlin government.

The move marks the first official recall of diesel vehicles that VW surreptitiously outfitted with software designed to meet emissions tests, then switch off pollution controls during real world operation. VW has said it produced about 11 million such vehicles with its EA 189 engine.

The scam was revealed last month by the U.S. Environmental Protection Agency. The EPA has yet to order a formal recall - though one is expected - in part because it has been working with VW to come up with an appropriate fix. The U.S. has some of the world's most stringent diesel emissions standards.

Complicating matters, it now appears that Volkswagen's 2016 diesels may be using a different type of software code to evade emissions mandates.

Thursday's order by German Transport Minister Alexander Dobrindt told VW "to remove the software from all vehicles and to take appropriate measures to ensure that the emissions rules are fulfilled."

The embattled automaker will have to provide German regulators with the code for a software fix by the end of this month. Repairs aren't scheduled to begin until early in 2016.

The mandatory recall in Germany means other EU countries will follow suit. Europe's biggest carmaker has said up to 8 million vehicles in the EU could contain banned software.

Last week, Volkswagen AG CEO Matthias Mueller said he expected to begin the repair of the 11 million diesel vehicles in January, with a goal of completing the "retrofit" by the end of 2016. Along with changing the software code on VW's EA 189 engine, some versions, especially a smaller 1.6-liter diesel, could require revisions to the engine itself, not just an update to the engine controller's code.

A fix might take longer in the U.S.

For one thing, Volkswagen has to prove to the EPA that any changes will continue to meet emissions standards for 150,000 miles. And because the American standards for smog-causing oxides of nitrogen (NOx) and particulate emissions are tougher than in Europe, VW insiders have said they expect they will have to modify engine hardware, as well.

Further complicating the situation, there have been two major updates to the 2.0-liter U.S. diesel since it was introduced. Earlier models may now require the addition of a urea injection system similar to what most other automakers use on their diesel vehicles. The ammonia-like chemical helps break down NOx into harmless components.

VW Plans to Overhaul Diesel Technology in Scandal's Wake

Meanwhile, the EPA has begun examining the software used on 2016 versions of some diesels that Volkswagen use different software code also aimed at fooling emissions tests.

VW on Tuesday told the Associated Press the "auxiliary emissions control device" on 2016 models operates differently from the so-called "defeat device" used on VW diesels during the previous seven years.

But so far VW but has provided regulators with few details.

"We have a long list of questions for VW about this," Janet McCabe, acting assistant EPA administrator for air quality, said this week. "We're getting some answers from them, but we do not have all the answers yet."

As a result of the disclosure, VW has withdrawn a request for the EPA to certify some of its 2016 diesel models for sale in the U.S. Whether the new software code actually violates U.S. emissions rules is unclear, however.

Toyota to Phase Out Gas-Powered Vehicles, Doubling Down on Hydrogen

If it does violate the rules, Volkswagen's problems could increase exponentially, some observers warn. The maker already faces potential fines from the EPA of more than $18 billion for the first software cheat. It is also facing a criminal investigation into the scandal by the U.S. Department of Justice. And at least a half-dozen class action lawsuits have now been filed on behalf of VW diesel owners.

Additional civil and criminal probes are underway abroad.

German Transport Minister Dobrindt said that while his agency had an "extraordinarily good" working relationship with VW as it continues its probe, for the moment, at least, it has "no information about who decided where, when at Volkswagen about the use of such software."

Since the diesel scam was revealed last month, VW has ousted its long-time CEO Martin Winterkorn, along with two of its top R&D executives. Meanwhile, Winfried Vahland, who was named just three weeks CEO of the new Volkswagen North America group tendered his resignation on Wednesday. The maker said that departure was "expressly not related" to the diesel scandal, but provided no other details.

Reuters contributed to this report.

WIRED:

http://www.wired.com/2015/10/dozens-of-managers-were-involved-in-vws-diesel-scandal/

DOZENS OF MANAGERS WERE INVOLVED IN VW'S DIESEL SCANDAL

ALEX DAVIES GEAR DATE OF PUBLICATION: 10.14.15

AT LEAST 30 Volkswagen managers played a role in using software to cheat on emissions testing on more than 10 million diesel cars, Der Spiegel reports.

The German magazine is citing reports by Volkswagen, as well as by law firm Jones Day, and says the managers will likely be suspended. A VW spokesperson says "This number is without foundation.

Due to the ongoing investigation we will not reveal the number nor the names of possible persons concerned."

Meanwhile, VW's newly chosen head of North America, Winfried Vahland, is leaving the company just two weeks after being designated for the post. According to a Reuters report, Vahland, who's been running VW's Skoda brand, is leaving over differences of opinion with the Board.

This week, VW announced it plans to recover from the scandal by increasing its focus on electric cars, including plans for a plug-in hybrid Phaeton sedan.

Flemingsburg Gazette:

VW scandal: Nine out of 10 United Kingdom customers demand compensation

Brittany Kelley | 15 October 2015, 12:15

Volkswagen has disclosed to USA regulators that there is additional suspect software in its 2016 diesel models that would potentially help their exhaust systems run cleaner during government tests. A VW spokesman confirmed that the company reported the device last week to the Environmental Protection Agency, which discovered the initial defeat device that allowed the company to cheat emissions tests. As the reputation of "clean diesel" small-car engines gets tarnished by Volkswagen AG's massive diesel-emissions scandal, the world's top automaker appears to be taking electric cars more seriously.

VW spokeswoman Jeannine Ginivan said the new issue with the 2016 vehicles was first revealed last week to U.S. Environmental Protection Agency and California regulators. The software at situation makes a air pollution-management catalyst warmth up quicker, enhancing efficiency of the system that separates smog-inflicting nitrogen oxide into innocent nitrogen and oxygen gases. During the course of a media briefing on Tuesday, EPA Assistant Administrator Janet McCabe said that the VW diesel vehicles supposedly equipped with the automaker's new emission-control device have not yet been certified for sale by the EPA. EPA's McCabe wouldn't say if VW's failure to disclose the software in its 2016 applications was illegal.

Diesel variations of the Passat sedan manufactured on the firm's plant in Chattanooga, Tennessee, are also on maintain. Earlier this week Volkswagen's United Kingdom boss Paul Willis said it was "premature" to discuss compensation. Asked for additional detail, a VW spokesperson on Monday said the software "has the function of a warmup strategy which is subject to approval" by EPA. It would suggest a deliberate effort by the company to cheat US emissions tests, which continued even after regulators pressed the company about the irregular emissions produced by the older cars previous year. Volkswagen already faced an ongoing criminal inquiry and billions in fines.

The existence of the new software was made public last week by Volkswagen Group of America president and CEO Michael Horn in testimony he gave to a congressional subcommittee investigating the scandal. In another blow to the carmaker on Wednesday, the man Volkswagen lined up less than three weeks ago to head its North American business resigned. Meanwhile, the US Federal Trade Commission, which probes companies accused of deceptive advertising, has joined the EPA and the Justice Department in investigating Volkswagen.

In the wake of the scandal, 86% of VW drivers are concerned about the environmental impact of their auto, while 83% questioned the impact on its resale value and 73% feared the performance of their vehicle would be affected.

Vermonters sue over VW's emissions trickery

Dan D'Ambrosio, Free Press Staff Writer 10:19 a.m. EDT October 15, 2015

Two class-action lawsuits have been filed in Vermont against Volkswagen for cheating on emissions testing.

In 2013, Bob Turnau of Charlotte bought a sleek, white Volkswagen Jetta Sportwagen TDI that

checked all the boxes for the environmentally and socially aware finance director at Resource in Burlington. The diesel-powered Jetta got great mileage and also met or exceeded all U.S. emission standards. And it had snappy acceleration.

"Around town I was getting 38 to 40 miles per gallon," Turnau said. "I made a big trip one year down South, it was over 50 miles per gallon. I really loved it for that.It was environmentally conscious, it had great fuel mileage and it was fun to drive. Those three things were really the troika of what led me to buy Volkswagen."

Then, in September it all fell apart when Volkswagen admitted to the U.S. Environmental Protection Agency and the California Air Resources Board that it had employed a sophisticated device to cheat U.S. emissions standards in diesel cars including the Audi A3, Beetle, Golf, Jetta and Passat.

"We take this matter very seriously," said Christopher Grundler, director of EPA's Office of Transportation and Air Quality in a press release in early October. "It's not only a violation of the Clean Air Act, it threatens public health and the credibility of the industry."

Boy, did it ever. Turnau, a resident of Charlotte, and thousands of his fellow Volkswagen owners across the country discovered their diesel-powered cars were only meeting emission standards when hooked up to testing equipment — the heart of the ploy implemented by sophisticated software — and they were spewing up to 40 times the allowed levels of nitrogen oxides when actually traveling down the road.

Turnau learned about the deception from news reports.

"It was complete disbelief," he said. "I bought a car that just wasn't what they told me it was."

Soon, disbelief turned to anger, and a determination not to be sidelined, waiting for Volkswagen to respond. Turnau called his friend, Tris Coffin, former U.S. Attorney for Vermont, now working in the private sector for Downs Rachlin Martin, PLLC in Burlington.

Lots of angry Vermonters

Turnau is the lead plaintiff in a class-action lawsuit brought by DRM against Volkswagen of America and its parent company, Volkswagen AG of Germany. Members of the class include all Vermonters who bought or owned diesel-powered Volkswagen Jetta, Golf, Passat or Audi A3 automobiles with model years from 2008 to present.

The lawsuit alleges buyers paid a higher price for the vehicles as compared to gasoline powered cars, in part because of company claims about lower emissions. Additionally, the value of the cars is lower because of the deception, and owners face unknown challenges in bringing the cars into compliance with federal regulations.

Turnau bought his Jetta based on Volkswagen's representations that it was an environmentally friendly, "emissions meeting or beating" car, which turned out to be a lie.

"One of the ways you can recover from that is by bringing a lawsuit," Coffin said.

Turnau agrees.

"I feel that this suit gives me a voice in what the outcome could be," he said.

Coffin said Tuesday that five more Vermonters have joined the lawsuit, including Chuck Lacy, former president and COO of Ben & Jerry's. Nearly 400 people have expressed interest in the lawsuit, he said.

Another class action lawsuit has been filed in Vermont by attorney Patrick Bernal of Witten, Woolmington, Campbell & Bernal, P.C. in Manchester Center. Bernal's lawsuit has two lead plaintiffs, and Bernal said he has been contacted by "scores" more Volkswagen owners in

Vermont.

"In my view Volkswagen did a terrible thing and it did it to lots of different people," Bernal said. "I represent a lot of angry Vermonters who feel absolutely betrayed."

The Lance Armstrong of automakers?

Across Vermont, there are about 3,000 affected Volkswagen owners, according to Tris Coffin. That makes Vermont one of the most affected states, per capita, said Attorney General Bill Sorrell, who announced an investigation into the diesel debacle on Sept. 24.

Sorrell said there are several potential issues. Has there been a violation of Vermont's consumer protection act for unfair or deceptive actions in commerce, as the Downs, Rachlin Martin lawsuit alleges? If found guilty, Volkswagen would be liable for triple damages. Has Volkswagen been selling vehicles in Vermont that violate the state's auto emission standards? Vermont has collected millions of dollars in penalties in other such cases alleging environmental violations and consumer fraud.

"We seek to recover monies on behalf of Vermonters who have been scammed, so we've got those issues of trying to see that Vermonters who bought those vehicles, including one of my sisters, are made whole from the losses they've suffered," Sorrell said.

Rep. Peter Welch has also been on the Volkswagen case, grilling the company's U.S. CEO Michael Horn in a House committee hearing last week. Before the hearing, Welch asked for questions and comments from Vermonters on his Facebook page.

"My fear is that VW is the Lance Armstrong of the car industry and they were just the first to be caught," said Shara Tarule.

"Just give me some cash and a new Audi," said Marshall Pierce.

"Fix it, just fix it," implored Kit Burns Wheatley.

"It's so outrageous what Volkswagen did that's it's hard to believe they did it," said Welch in an interview on Tuesday. "It took self-conscious planning and careful execution to install this software that would defeat the testing. There's a part of everybody who learned about this that was just flabbergasted. Why would a company do that? How did they think they would get away with it?"

No write-offs

One of the comments Welch got from his constituents concerned the potential for Volkswagen to write off part of the federal penalties that might result from the company's actions, which could run into the billions of dollars. Forbes reported last week that in a potential out-of-court settlement regarding the Gulf oil spill, BP would be able to write off $15.3 billion of a $20.8 billion penalty. Only $5.5 billion would be designated as a non-tax-deductible Clean Water Act penalty.

Welch asked Horn in the hearing whether he would agree that Volkswagen wouldn't take advantage of the tax code to shift some of the burden of any penalties to taxpayers.

"He said he didn't know what the law was, but he didn't think taxpayers should share in the burden," Welch said. "That sent a signal to Volkswagen headquarters that not only is this a problem, but it's a real problem."

Welch has introduced a bill, "The Stop Deducting Damages Act of 2015 (H.R. 2456)" that would close the loophole that allows companies like BP to shift some of the burden of their fines to taxpayers. The bill has been referred to House Ways and Means.

Welch also spoke to Bill Shearer, owner of Shearer Volkswagen in South Burlington, to get an

idea of the impact the diesel debacle has had on dealers. Welch sympathizes with Shearer, whom he points out had nothing to do with the disastrous decisions that led to the deceit perpetrated on Volkswagen customers.

"Our dealers have relationships with their customers, they tend to be family businesses," Welch said. "He's going to have a hit in his sales and obviously this will affect his bottom line. He's going to keep his trusted and valued employees on, that's what he told me."

Round up the bad guys

Shearer confirmed he was not planning any layoffs. He owns five dealerships, including Volkswagen, GM, Honda, Acura and Audi, with a total of 200 employees. Four of the dealerships are in the Burlington area and one is in Rutland. Shearer said Volkswagen represents 30 percent of his new car sales.

"It's a terrible thing for our customers and for the employees and families that have a big stake in Volkswagen," Shearer said. "I feel terrible for those people, but we'll make it work. We've been through GM bankruptcy and other recalls."

Something went awry at Volkswagen, Shearer said, but he's confident the German company will pull through in the end.

"It's a quality company and something bad happened," he said. "They're going to pick it apart and see who did what. I know these people. I know Michael Horn. They're determined to fix it for every customer. I'm determined to be part of that happening."

Once Volkswagen determines who did what, those people should be fired, said Matthew Dodds of Brandthropology, a marketing firm in Burlington. Martin Winterkorn, CEO since 2007, resigned in September, saying he was not aware of any wrongdoing on his part.

"They got to terminate everybody who either approved or turned a blind eye to what happened," Dodds said. "You have to excise that part of the culture that allowed that to happen. If you don't do that I don't believe it's credible."

That task falls to the new CEO, Matthias Müller, according to Dodds.

"It has to come out of the voice of the new sheriff in town, he has to round up the bad guys," Dodds said.

Second, Volkswagen has to make its customers whole, no matter the cost.

"Take it on the chin and take care of your customer base," Dodds said. "Give until it hurts. Make it painful for yourself because here's the deal: People in love with the brand will reward you with loyalty."

Michael Jager of Solidarity of Unbridled Labour in Burlington, agrees with Dodds that Volkswagen must pay until it hurts. But he worries that the damage goes much deeper than angry customers who must be made whole. He said the "amplified perception" of German engineering, embodying precision and quality, makes the deceit even worse, calling the company's entire culture into question.

"The way they calculatedly did this, to create this lie, takes German engineering and design prowess and amplifies it in the opposite direction," Jager said.

To reverse the damage is going to take an unprecedented response, Jager said.

"Could you imagine something as bold as giving people their money back, taking back the cars, repairing them and giving them to car shares across the country?" he said. "With a move like that, they might win back their customers."

Europe's love affair with diesel cars has been a disaster

Updated by Brad Plumer on October 15, 2015, 1:00 p.m. ET @bradplumer brad@vox.com

The recent news that Volkswagen had been illegally rigging its diesel-powered cars to cheat on pollution tests has sparked plenty of outrage. Hearings, lawsuits, fines, general opprobrium. And rightly so; the company's deception was appalling.

But there's a much broader, far more consequential problem here that a lot of coverage has danced around or hinted at only indirectly. So let's say it: Europe's longtime promotion of diesel vehicles as a "green" transportation option has been a complete and total disaster — for reasons that go well beyond the Volkswagen scandal.

Ever since the 1990s, European governments have been encouraging drivers to buy diesel cars as an alternative to traditional gasoline-powered vehicles. The rationale was simple: Diesel engines use fuel more efficiently, so the switch was supposed to reduce carbon dioxide emissions and help stave off global warming. Thanks to tax breaks and other incentives, diesel cars now make up one-third of Europe's fleet, whereas they're a sideshow in the US and Japan:

Europe's diesel push might have seemed sensible once upon a time. But 20 years later, with the benefit of hindsight, it looks like a huge mistake, an impotent climate policy that had all sorts of unintended consequences.

The biggest drawback of diesel cars is that they emit higher levels of other harmful air pollutants like particulates and nitrogen oxides. And those ended up being far harder to clean up than experts initially predicted. We now know that Europe's regulators have failed spectacularly to control diesel pollution, relying on weak rules and flimsy testing procedures. Lots and lots of automakers — not just Volkswagen — have been manufacturing diesel cars that emit far more gunk than they're supposed to. As a result, cities like London and Paris are clogged with dangerously high levels of air pollution, causing thousands of premature deaths each year.

And that's not the worst part. It's now looking like Europe's diesel push didn't even do anything to help global warming, as one 2013 study by Michel Cames and Eckard Helmers found. The CO2 benefits from switching to diesel cars were overrated and offset by the extra soot their engines produced. Plus, Europe's entrenched diesel industry has impeded progress on more promising hybrid and electric car technologies that could've provide deeper emissions cuts.

The whole episode is a sobering case study in how well-intentioned green industrial policy can go horribly wrong. So let's roll the tape and see what lessons we can learn from Europe's decades-long diesel fiasco.

Why Europe embraced diesel cars in the 1980s and '90s

After crude oil gets pumped out of the ground, it's sent to refineries to be turned into usable fuel. Those refineries typically distill the oil into lighter and heavier components. The lightest stuff includes gasoline. On the heavier side is diesel fuel, which contains more energy per gallon.

For most of the 20th century, automakers largely designed cars to run on gasoline, which was more flammable and combusted easily using sparks. Engines that could combust diesel fuel, using air compression, had been invented in the 19th century, but they were noisier and belched more smoke, so they were mostly confined to large ships and trucks. Diesel was often used instead for heating and producing electricity.

But starting in the 1980s, French and German automakers began showing more interest in developing diesel-powered cars. The reasons have always been a little murky, although Cames

and Helmers suggest it traces back to the OPEC oil crises of the 1970s. After global crude prices spiked, France decided to swear off using diesel for electricity and built a bunch of nuclear plants instead. Germany, meanwhile, switched from oil to natural gas for heating. When the crisis finally subsided, Europe's refiners were still producing lots of diesel with no buyers. So governments began urging automakers like Peugeot to look into diesel-powered vehicles.

By the late 1990s, diesel technology had improved dramatically, thanks to advances in fuel injection — common rail, especially — that allowed the engines to run more quietly. The newer diesel engines were a technical marvel, operating more efficiently than their gasoline counterparts and using less fuel per mile traveled (and, hence, emitting less carbon dioxide per mile). All they needed was a market.

Rising concern over global warming provided that push. In 1997, the European Union signed the Kyoto Protocol and committed to cutting its heat-trapping carbon dioxide emissions roughly 8 percent by 2012. The next year, the EU reached a landmark agreement with the continent's car manufacturers on reducing CO2.

At the time, there were lots of different paths Europe's automakers could have taken to green itself. They could've pursued direct injection technology for gasoline vehicles, making those engines more fuel-efficient. They could've ramped up R&D of hybrid electric car technology, as Japanese automakers like Toyota were starting to do. But European companies like Peugeot and Volkswagen and BMW had already been making big investments in diesel, and they wanted a climate policy that would allow those bets to pay off.

Europe's policymakers obliged. The EU agreed to a voluntary CO2 target for vehicles that was basically in line with what diesel technology would be able to meet. As researcher Sarah Keay-Bright later noted, these standards were explicitly crafted so as not to force Europe's automakers to develop hybrids, electric vehicles, or other more advanced power trains.

Soon thereafter, European nations — including Britain, France, Germany, Italy, Spain, and Austria — began cutting taxes on diesel fuel and diesel car purchases to promote sales, all in the name of thwarting climate change. Diesel sales soared. Back in 1990, just 10 percent of new car registrations in Europe had run on diesel. By 2011, that had climbed to nearly 60 percent.

Today, Europe's diesel cars are a public health nightmare

Diesel engines do have one big pitfall. They may be more fuel-efficient and emit less CO2, but their engines tend to emit higher levels of other nasty air pollutants, including soot, particulates, and nitrogen oxides (NOx). Heavy exposure to these air pollutants can exacerbate heart and lung disease, trigger asthma attacks, and even cause premature death.

Everyone knew this back in the 1990s. Europe's regulators simply considered the trade-off acceptable. "At the time, the prevailing belief was that climate change was the really hard problem and should be the priority, whereas we'd had experience improving air quality, so everyone assumed we could easily fix that issue later," explains Martin Williams, an air pollution researcher at King's College London who previously worked for Britain's environmental agency.

That assumption turned out to be wrong. When European regulators later moved to clamp down on NOx and other conventional air pollution from diesel vehicles, they failed miserably.

Starting in 2000, the EU began ratcheting down the legal limits for NOx emissions (though Europe's diesel cars have always been allowed to emit NOx at a relatively higher rate than gasoline-powered cars). New vehicles were tested in laboratories, where cars were placed on giant treadmills, spun through a few exercises, and measured for pollution.

Trouble was, these tests turned out to be incredibly flimsy and easily gamed, explains John German of the International Council on Clean Transportation. Automakers could send cars to labs that were optimized for testing: stripped of excess weight, with the air conditioning turned off, and so on. The test cars complied with the pollution limits just fine. But the cars that were actually being sold to consumers were quite different, with much higher emissions. (German says this sort of subtle gaming was technically legal, unlike Volkswagen's more elaborate deception, which involved illegal software that only turned pollution controls on during tests. Still, even if Volkswagen was the most flagrant cheater, it was hardly unique.)

Few realized the EU's pollution tests were badly flawed until 2010, when researchers started studying emissions from vehicles that were actually on the road. In one study, Williams set up roadside infrared detectors to measure NOx pollution from cars in seven British cities. What he found was shocking: Europe's newest diesel cars were emitting roughly as much NOx as older

diesel cars from the 1990s.

In other words, 20 years of increasingly strict air pollution regulations had done absolutely nothing to reduce pollution. "That was the most surprising part," Williams says.

By that point, the damage had been done. Today, Paris occasionally jousts with Beijing for the title of world's most polluted city. London is grappling with unsafe levels of nitrogen dioxide. Germany, Austria, and Ireland have NOx pollution well above the legal limits.

And the health toll has been staggering. One recent study found that diesel pollution from cars, buses, and trucks in Britain caused 9,400 premature deaths in 2010 alone. It's difficult to suss out what fraction of those deaths might have been avoided if emission rules had been properly enforced all along, but that gives some sense of the brutal cost here.

To be fair, European regulators have scrambled to improve the tests now that they've realized what was happening. But it's still unclear whether the diesel car industry can ever clean up its act.

Starting in 2014, the newest, most stringent emissions standard — known as Euro 6 — will require diesel cars to emit no more than 0.08 grams of NOx per kilometer, an 84 percent reduction from 2000-era levels. Europe's regulators will also start requiring on-road testing in addition to laboratory checkups. (That's what the United States EPA does, and it should eliminate most gaming, although, as the Volkswagen scandal showed, truly determined cheaters are hard to detect.)

But here's the fat asterisk: Now that they can no longer easily game the system, Europe's automakers are lobbying hard to relax the pollution standards. That's because it's not very easy to cut NOx pollution from diesel cars. One of the technologies that could meet the most stringent limits, known as selective catalytic reduction, involves running the car's exhaust through a honeycombed chamber that sprays urea and water, which breaks the NOx down into harmless nitrogen, oxygen, and water molecules. But these devices can add about $5,000 to $8,000 to the price of a vehicle, which would make many small cars uneconomical. They can also negatively affect fuel economy, torque, and other aspects of the car's performance.

So the jury's still out on whether "clean diesel" cars will even be viable in practice. Volkswagen had claimed to have cracked the problem with its most recent diesel models ... except we now know the company was doing it by rigging the cars with software to evade pollution tests.

The grim irony: Europe's diesel push hasn't helped with global warming

If Europe's diesel surge had helped mitigate climate change, then maybe (just maybe) you could argue that all this extra air pollution was worth it. Except here's the grim plot twist: The climate benefits appear to have been negligible.

In their 2013 paper, Cames and Helmers argued that Europe is probably worse off today, from a global warming perspective, than it would have been if automakers had just focused on improving gasoline-powered cars all along. And Europe is arguably much worse off than it would have been if automakers had started investing in hybrid electric technology back in the 1990s.

The authors offer up this chart, showing that Europe's diesel cars may have once had a sizable CO2 advantage over traditional gasoline vehicles. But today that gap has virtually disappeared, as new technologies like turbochargers have made gasoline engines nearly as efficient as diesel cars:

What's more, there are two subtle drawbacks to diesel engines that make them worse for global warming than they seem.

First, even if diesel cars emit less CO2 than gasoline vehicles, they emit a lot more black carbon, or soot, a pollutant that (we've recently learned) also contributes significantly to global warming. The precise accounting here is still subject to some dispute, but Cames and Helmers point out that black carbon emissions from diesel cars likely negate a big chunk of their CO2 advantage.

Second, remember that European countries encouraged diesel car adoption by slashing taxes on

the diesel fuel itself (compared with gasoline). But as any Econ 101 student will tell you, cutting fuel prices gives people an incentive to drive more miles — and increase their overall emissions. This further chips away at any climate advantage diesel might have.

Add it up, and Cames and Helmers conclude that "the European diesel car boom did not cool down the atmosphere."

One final coda here. Go back and look at the Japanese cars on the graph above. Back in the late 1990s, Japanese automakers were also thinking about cutting CO2, but they figured that diesel was a dead-end technology, since the cost of cleaning up the extra NOx pollution would be too high. Instead, companies like Toyota started investing in hybrid vehicles, with the first Prius appearing in 1997. By contrast, Europe's automakers initially scoffed at electric powertrains, and none of them even bothered producing hybrids until Mercedes finally rolled one out in 2009.

Japan's decision now looks prescient, and Europe's looks shortsighted. Hybrids proved much greener: The newest Japanese cars now produce roughly 10 percent less CO2 per mile than Europe's diesel vehicles do, on average. And Japan's automakers appear to be better set up for the future. Many experts now think that transportation will eventually have to become electrified if we want truly deep reductions in emissions. But European automakers, stuck on diesel for so long, are scrambling to catch up.

Europe is now struggling to undo its diesel mistake — but it's not easy

Debate Over Vehicle Emissions Intensifies As Volkswagen Scandal Widens

Because of the Volkswagen scandal, and the staggering levels of pollution in cities like Paris and London, Europe's policymakers are now beginning to rethink their fondness for diesel cars. But it's a hard technology to give up. Path dependency is a hell of a drug.

In diesel-loving France, Ségolène Royal, the environment minister, recently said that the country would consider phasing out preferential tax breaks for diesel over the next five years. "We need to start preparing our move out of diesel," she reportedly told France 5 television. But she's also bristled at any suggestion that France should act too quickly. After all, diesel cars still account for more than 60 percent of all European sales for Renault and Peugeot, two major local

manufacturers. They can't just unwind those positions overnight.

Volkswagen, for its part, is also engaged in a bit of soul searching around diesel (at least, when it's not recalling its 11 million law-breaking diesel cars and dealing with criminal investigations). The company recently announced that it would take a major plunge into electric powertrains, creating a standardized architecture for a new wave of plug-in cars. "The Volkswagen brand is repositioning itself for the future," said executive Herbert Diess. Except, of course, this shift won't happen overnight. Because VW spent so many years dreaming up ways to evade regulators and sell diesel cars, it's now playing catch-up to electric car companies like Tesla.

In the meantime, Europe's smoggy cities still have to grapple with the fallout from all those polluting diesel cars that are still on the road — and will likely stick around for years. The EU has started to pressure countries with the worst air pollution. Cities like London, Stockholm, and Milan are already experimenting with emission-free zones. In the future, drivers with old diesel clunkers could have to pay extra to travel downtown in certain cities. But even this cleanup will take years.

Energy bets can sometimes go horribly wrong. So how do we avoid that?

Europe's misadventure with diesel cars is a great case study in how energy policy can go very badly awry, and no doubt there's a long list of lessons to draw. I'll just mention a few big ones:

First, Europe's complete failure to regulate diesel pollution is worth studying. Not only had regulators designed flimsy emissions tests — partly at the behest of industry lobbying — but it took two decades to even realize the tests were failing. Crafting ambitious environmental rules is all well and good, but without ample enforcement and monitoring, those rules are basically pointless. (Note that China is now pursuing ambitious climate policies of its own, but experts keep muttering that enforcement will be a big challenge — a caveat that deserves much more attention.)

Another possible takeaway is that if we really want to reduce greenhouse gas emissions from the transportation sector, liquid fuels are ultimately a dead end and electrification is the best path forward. There's no shortage of experts who believe that, and certainly that's the lesson Volkswagen seems to be drawing from this fiasco. That said, it's worth noting that Toyota, which

was ahead of the pack in developing hybrid electrics in the late 1990s, actually doesn't believe electric cars are the future and is pouring R&D into hydrogen cars instead.

Which brings us to the third takeaway. The future is hard to predict. Diesel cars seemed like a reasonable idea in the 1990s and a disaster today. That suggests that policymakers should have a lot more humility when crafting energy policy. One approach might be to pursue more technology-neutral policies organized around preferred outcomes — say, tightly enforced standards that require lower emissions — rather than favoring specific industries just because they happen to seem promising at that moment in time.

This issue comes up again and again. For years, governments have been laying down big bets on emerging clean energy technologies. France did it with nuclear power in the 1970s and '80s. Germany did it with wind and solar power in the 2000s, through feed-in tariffs. The United States did it with corn ethanol in 2005.

Done right, this sort of government support can be valuable, helping useful new energy options break into the mainstream against entrenched competition. But the biggest risk is that governments end up gambling on badly flawed technologies that then become the entrenched competition and prove impossible to get rid of. The US arguably made that mistake with corn ethanol, which has had unintended ripple effects on the food supply and deforestation and is proving politically difficult to wind down. Now it's clear that Europe made that mistake, too.

Europe's love affair with diesel cars has been a disaster

Updated by Brad Plumer on October 15, 2015, 1:00 p.m. ET @bradplumer brad@vox.com

The recent news that Volkswagen had been illegally rigging its diesel-powered cars to cheat on pollution tests has sparked plenty of outrage. Hearings, lawsuits, fines, general opprobrium. And rightly so; the company's deception was appalling.

But there's a much broader, far more consequential problem here that a lot of coverage has danced around or hinted at only indirectly. So let's say it: Europe's longtime promotion of diesel vehicles as a "green" transportation option has been a complete and total disaster — for reasons that go well beyond the Volkswagen scandal.

Ever since the 1990s, European governments have been encouraging drivers to buy diesel cars as an alternative to traditional gasoline-powered vehicles. The rationale was simple: Diesel engines use fuel more efficiently, so the switch was supposed to reduce carbon dioxide emissions and help stave off global warming. Thanks to tax breaks and other incentives, diesel cars now make up one-third of Europe's fleet, whereas they're a sideshow in the US and Japan:

Europe's diesel push might have seemed sensible once upon a time. But 20 years later, with the benefit of hindsight, it looks like a huge mistake, an impotent climate policy that had all sorts of unintended consequences.

The biggest drawback of diesel cars is that they emit higher levels of other harmful air pollutants like particulates and nitrogen oxides. And those ended up being far harder to clean up than experts initially predicted. We now know that Europe's regulators have failed spectacularly to control diesel pollution, relying on weak rules and flimsy testing procedures. Lots and lots of automakers — not just Volkswagen — have been manufacturing diesel cars that emit far more gunk than they're supposed to. As a result, cities like London and Paris are clogged with dangerously high levels of air pollution, causing thousands of premature deaths each year.

And that's not the worst part. It's now looking like Europe's diesel push didn't even do anything to help global warming, as one 2013 study by Michel Cames and Eckard Helmers found. The CO2 benefits from switching to diesel cars were overrated and offset by the extra soot their engines produced. Plus, Europe's entrenched diesel industry has impeded progress on more promising hybrid and electric car technologies that could've provide deeper emissions cuts.

The whole episode is a sobering case study in how well-intentioned green industrial policy can go horribly wrong. So let's roll the tape and see what lessons we can learn from Europe's decades-long diesel fiasco.

Why Europe embraced diesel cars in the 1980s and '90s

After crude oil gets pumped out of the ground, it's sent to refineries to be turned into usable fuel. Those refineries typically distill the oil into lighter and heavier components. The lightest stuff includes gasoline. On the heavier side is diesel fuel, which contains more energy per gallon.

For most of the 20th century, automakers largely designed cars to run on gasoline, which was more flammable and combusted easily using sparks. Engines that could combust diesel fuel, using air compression, had been invented in the 19th century, but they were noisier and belched more smoke, so they were mostly confined to large ships and trucks. Diesel was often used instead for heating and producing electricity.

But starting in the 1980s, French and German automakers began showing more interest in developing diesel-powered cars. The reasons have always been a little murky, although Cames and Helmers suggest it traces back to the OPEC oil crises of the 1970s. After global crude prices spiked, France decided to swear off using diesel for electricity and built a bunch of nuclear plants instead. Germany, meanwhile, switched from oil to natural gas for heating. When the crisis finally subsided, Europe's refiners were still producing lots of diesel with no buyers. So governments began urging automakers like Peugeot to look into diesel-powered vehicles.

By the late 1990s, diesel technology had improved dramatically, thanks to advances in fuel injection — common rail, especially — that allowed the engines to run more quietly. The newer diesel engines were a technical marvel, operating more efficiently than their gasoline counterparts and using less fuel per mile traveled (and, hence, emitting less carbon dioxide per mile). All they needed was a market.

Rising concern over global warming provided that push. In 1997, the European Union signed the Kyoto Protocol and committed to cutting its heat-trapping carbon dioxide emissions roughly 8 percent by 2012. The next year, the EU reached a landmark agreement with the continent's car manufacturers on reducing CO2.

At the time, there were lots of different paths Europe's automakers could have taken to green itself. They could've pursued direct injection technology for gasoline vehicles, making those engines more fuel-efficient. They could've ramped up R&D of hybrid electric car technology, as Japanese automakers like Toyota were starting to do. But European companies like Peugeot and Volkswagen and BMW had already been making big investments in diesel, and they wanted a climate policy that would allow those bets to pay off.

Europe's policymakers obliged. The EU agreed to a voluntary CO2 target for vehicles that was basically in line with what diesel technology would be able to meet. As researcher Sarah Keay-Bright later noted, these standards were explicitly crafted so as not to force Europe's automakers to develop hybrids, electric vehicles, or other more advanced power trains.

Soon thereafter, European nations — including Britain, France, Germany, Italy, Spain, and Austria — began cutting taxes on diesel fuel and diesel car purchases to promote sales, all in the name of thwarting climate change. Diesel sales soared. Back in 1990, just 10 percent of new car registrations in Europe had run on diesel. By 2011, that had climbed to nearly 60 percent.

Today, Europe's diesel cars are a public health nightmare

Diesel engines do have one big pitfall. They may be more fuel-efficient and emit less CO2, but their engines tend to emit higher levels of other nasty air pollutants, including soot, particulates, and nitrogen oxides (NOx). Heavy exposure to these air pollutants can exacerbate heart and lung disease, trigger asthma attacks, and even cause premature death.

Everyone knew this back in the 1990s. Europe's regulators simply considered the trade-off acceptable. "At the time, the prevailing belief was that climate change was the really hard problem and should be the priority, whereas we'd had experience improving air quality, so everyone assumed we could easily fix that issue later," explains Martin Williams, an air pollution researcher at King's College London who previously worked for Britain's environmental agency.

That assumption turned out to be wrong. When European regulators later moved to clamp down on NOx and other conventional air pollution from diesel vehicles, they failed miserably.

Starting in 2000, the EU began ratcheting down the legal limits for NOx emissions (though Europe's diesel cars have always been allowed to emit NOx at a relatively higher rate than gasoline-powered cars). New vehicles were tested in laboratories, where cars were placed on giant treadmills, spun through a few exercises, and measured for pollution.

Trouble was, these tests turned out to be incredibly flimsy and easily gamed, explains John German of the International Council on Clean Transportation. Automakers could send cars to labs that were optimized for testing: stripped of excess weight, with the air conditioning turned off, and so on. The test cars complied with the pollution limits just fine. But the cars that were actually being sold to consumers were quite different, with much higher emissions. (German says this sort of subtle gaming was technically legal, unlike Volkswagen's more elaborate deception, which involved illegal software that only turned pollution controls on during tests. Still, even if Volkswagen was the most flagrant cheater, it was hardly unique.)

Few realized the EU's pollution tests were badly flawed until 2010, when researchers started studying emissions from vehicles that were actually on the road. In one study, Williams set up roadside infrared detectors to measure NOx pollution from cars in seven British cities. What he found was shocking: Europe's newest diesel cars were emitting roughly as much NOx as older diesel cars from the 1990s.

In other words, 20 years of increasingly strict air pollution regulations had done absolutely nothing to reduce pollution. "That was the most surprising part," Williams says.

By that point, the damage had been done. Today, Paris occasionally jousts with Beijing for the title of world's most polluted city. London is grappling with unsafe levels of nitrogen dioxide. Germany, Austria, and Ireland have NOx pollution well above the legal limits.

(Note that China is now pursuing ambitious climate policies of its own, but experts keep muttering that enforcement will be a big challenge — a caveat that deserves much more attention.)

Another possible takeaway is that if we really want to reduce greenhouse gas emissions from the transportation sector, liquid fuels are ultimately a dead end and electrification is the best path forward. There's no shortage of experts who believe that, and certainly that's the lesson Volkswagen seems to be drawing from this fiasco. That said, it's worth noting that Toyota, which was ahead of the pack in developing hybrid electrics in the late 1990s, actually doesn't believe electric cars are the future and is pouring R&D into hydrogen cars instead.

Which brings us to the third takeaway. The future is hard to predict. Diesel cars seemed like a reasonable idea in the 1990s and a disaster today. That suggests that policymakers should have a lot more humility when crafting energy policy. One approach might be to pursue

more technology-neutral policies organized around preferred outcomes — say, tightly enforced standards that require lower emissions — rather than favoring specific industries just because they happen to seem promising at that moment in time.

This issue comes up again and again. For years, governments have been laying down big bets on emerging clean energy technologies. France did it with nuclear power in the 1970s and '80s. Germany did it with wind and solar power in the 2000s, through feed-in tariffs. The United States did it with corn ethanol in 2005.

Done right, this sort of government support can be valuable, helping useful new energy options break into the mainstream against entrenched competition. But the biggest risk is that governments end up gambling on badly flawed technologies that then become the entrenched competition and prove impossible to get rid of. The US arguably made that mistake with corn ethanol, which has had unintended ripple effects on the food supply and deforestation and is proving politically difficult to wind down. Now it's clear that Europe made that mistake, too.

Europe's love affair with diesel cars has been a disaster

Updated by Brad Plumer on October 15, 2015, 1:00 p.m. ET @bradplumer brad@vox.com

The recent news that Volkswagen had been illegally rigging its diesel-powered cars to cheat on pollution tests has sparked plenty of outrage. Hearings, lawsuits, fines, general opprobrium. And rightly so; the company's deception was appalling.

But there's a much broader, far more consequential problem here that a lot of coverage has danced around or hinted at only indirectly. So let's say it: Europe's longtime promotion of diesel vehicles as a "green" transportation option has been a complete and total disaster — for reasons that go well beyond the Volkswagen scandal.

Ever since the 1990s, European governments have been encouraging drivers to buy diesel cars as an alternative to traditional gasoline-powered vehicles. The rationale was simple: Diesel engines use fuel more efficiently, so the switch was supposed to reduce carbon dioxide emissions and help stave off global warming. Thanks to tax breaks and other

incentives, diesel cars now make up one-third of Europe's fleet, whereas they're a sideshow in the US and Japan:

Europe's diesel push might have seemed sensible once upon a time. But 20 years later, with the benefit of hindsight, it looks like a huge mistake, an impotent climate policy that had all sorts of unintended consequences.

The biggest drawback of diesel cars is that they emit higher levels of other harmful air pollutants like particulates and nitrogen oxides. And those ended up being far harder to clean up than experts initially predicted. We now know that Europe's regulators have failed spectacularly to control diesel pollution, relying on weak rules and flimsy testing procedures. Lots and lots of automakers — not just Volkswagen — have been manufacturing diesel cars that emit far more gunk than they're supposed to. As a result, cities like London and Paris are clogged with dangerously high levels of air pollution, causing thousands of premature deaths each year.

And that's not the worst part. It's now looking like Europe's diesel push didn't even do anything to help global warming, as one 2013 study by Michel Cames and Eckard Helmers found. The CO2 benefits from switching to diesel cars were overrated and offset by the extra soot their engines produced. Plus, Europe's entrenched diesel industry has impeded progress on more promising hybrid and electric car technologies that could've provide deeper emissions cuts.

The whole episode is a sobering case study in how well-intentioned green industrial policy can go horribly wrong. So let's roll the tape and see what lessons we can learn from Europe's decades-long diesel fiasco.

Why Europe embraced diesel cars in the 1980s and '90s

After crude oil gets pumped out of the ground, it's sent to refineries to be turned into usable fuel. Those refineries typically distill the oil into lighter and heavier components. The lightest stuff includes gasoline. On the heavier side is diesel fuel, which contains more energy per gallon.

For most of the 20th century, automakers largely designed cars to run on gasoline, which was more flammable and combusted easily using sparks. Engines that could combust diesel fuel, using air compression, had been invented in the 19th century, but they were noisier and belched more smoke, so they were mostly confined to large ships and trucks. Diesel was often used instead for heating and producing electricity.

But starting in the 1980s, French and German automakers began showing more interest in developing diesel-powered cars. The reasons have always been a little murky, although Cames and Helmers suggest it traces back to the OPEC oil crises of the 1970s. After global crude prices spiked, France decided to swear off using diesel for electricity and built a bunch of nuclear plants instead. Germany, meanwhile, switched from oil to natural gas for heating. When the crisis finally subsided, Europe's refiners were still producing lots of diesel with no buyers. So governments began urging automakers like Peugeot to look into diesel-powered vehicles.

By the late 1990s, diesel technology had improved dramatically, thanks to advances in fuel injection — common rail, especially — that allowed the engines to run more quietly. The newer diesel engines were a technical marvel, operating more efficiently than their gasoline counterparts and using less fuel per mile traveled (and, hence, emitting less carbon dioxide per mile). All they needed was a market.

Rising concern over global warming provided that push. In 1997, the European Union signed the Kyoto Protocol and committed to cutting its heat-trapping carbon dioxide emissions roughly 8 percent by 2012. The next year, the EU reached a landmark agreement with the continent's car manufacturers on reducing CO2.

At the time, there were lots of different paths Europe's automakers could have taken to green itself. They could've pursued direct injection technology for gasoline vehicles, making those engines more fuel-efficient. They could've ramped up R&D of hybrid electric car technology, as Japanese automakers like Toyota were starting to do. But European companies like Peugeot and Volkswagen and BMW had already been making big investments in diesel, and they wanted a climate policy that would allow those bets to pay off.

Europe's policymakers obliged. The EU agreed to a voluntary CO2 target for vehicles that was basically in line with what diesel technology would be able to meet. As researcher Sarah Keay-Bright later noted, these standards were explicitly crafted so as not to force Europe's automakers to develop hybrids, electric vehicles, or other more advanced power trains.

Soon thereafter, European nations — including Britain, France, Germany, Italy, Spain, and Austria — began cutting taxes on diesel fuel and diesel car purchases to promote sales, all in the name of thwarting climate change. Diesel sales soared. Back in 1990, just 10 percent of new car registrations in Europe had run on diesel. By 2011, that had climbed to nearly 60 percent.

Today, Europe's diesel cars are a public health nightmare

Diesel engines do have one big pitfall. They may be more fuel-efficient and emit less CO2, but their engines tend to emit higher levels of other nasty air pollutants, including soot, particulates, and nitrogen oxides (NOx). Heavy exposure to these air pollutants can exacerbate heart and lung disease, trigger asthma attacks, and even cause premature death.

Everyone knew this back in the 1990s. Europe's regulators simply considered the trade-off acceptable. "At the time, the prevailing belief was that climate change was the really hard problem and should be the priority, whereas we'd had experience improving air quality, so everyone assumed we could easily fix that issue later," explains Martin Williams, an air pollution researcher at King's College London who previously worked for Britain's environmental agency.

That assumption turned out to be wrong. When European regulators later moved to clamp down on NOx and other conventional air pollution from diesel vehicles, they failed miserably.

Starting in 2000, the EU began ratcheting down the legal limits for NOx emissions (though Europe's diesel cars have always been allowed to emit NOx at a relatively higher rate than gasoline-powered cars). New vehicles were tested in laboratories, where cars were placed on giant treadmills, spun through a few exercises, and measured for pollution.

Trouble was, these tests turned out to be incredibly flimsy and easily gamed, explains John German of the International Council on Clean Transportation. Automakers could send cars to labs that were optimized for testing: stripped of excess weight, with the air conditioning turned off, and so on. The test cars complied with the pollution limits just fine. But the cars that were actually being sold to consumers were quite different, with much higher emissions. (German says this sort of subtle gaming was technically legal, unlike Volkswagen's more elaborate deception, which involved illegal software that only turned pollution controls on during tests. Still, even if Volkswagen was the most flagrant cheater, it was hardly unique.)

Few realized the EU's pollution tests were badly flawed until 2010, when researchers started studying emissions from vehicles that were actually on the road. In one study, Williams set up roadside infrared detectors to measure NOx pollution from cars in seven British cities. What he found was shocking: Europe's newest diesel cars were emitting roughly as much NOx as older diesel cars from the 1990s.

In other words, 20 years of increasingly strict air pollution regulations had done absolutely nothing to reduce pollution. "That was the most surprising part," Williams says.

By that point, the damage had been done. Today, Paris occasionally jousts with Beijing for the title of world's most polluted city. London is grappling with unsafe levels of nitrogen dioxide. Germany, Austria, and Ireland have NOx pollution well above the legal limits.

And the health toll has been staggering. One recent study found that diesel pollution from cars, buses, and trucks in Britain caused 9,400 premature deaths in 2010 alone. It's difficult to suss out what fraction of those deaths might have been avoided if emission rules had been properly enforced all along, but that gives some sense of the brutal cost here.

To be fair, European regulators have scrambled to improve the tests now that they've realized what was happening. But it's still unclear whether the diesel car industry can ever clean up its act.

Starting in 2014, the newest, most stringent emissions standard — known as Euro 6 — will require diesel cars to emit no more than 0.08 grams of NOx per kilometer, an 84 percent reduction from 2000-era levels. Europe's regulators will also start requiring on-road testing in addition to laboratory checkups. (That's what the United States EPA does, and it should eliminate most gaming, although, as the Volkswagen scandal showed, truly determined cheaters are hard to detect.)

But here's the fat asterisk: Now that they can no longer easily game the system, Europe's automakers are lobbying hard to relax the pollution standards. That's because it's not very easy to cut NOx pollution from diesel cars. One of the technologies that could meet the most stringent limits, known as selective catalytic reduction, involves running the car's exhaust through a honeycombed chamber that sprays urea and water, which breaks the NOx down into harmless nitrogen, oxygen, and water molecules. But these devices can add about $5,000 to $8,000 to the price of a vehicle, which would make many small cars uneconomical. They can also negatively affect fuel economy, torque, and other aspects of the car's performance.

So the jury's still out on whether "clean diesel" cars will even be viable in practice. Volkswagen had claimed to have cracked the problem with its most recent diesel models ... except we now know the company was doing it by rigging the cars with software to evade pollution tests.

The grim irony: Europe's diesel push hasn't helped with global warming

If Europe's diesel surge had helped mitigate climate change, then maybe (just maybe) you could argue that all this extra air pollution was worth it. Except here's the grim plot twist: The climate benefits appear to have been negligible.

In their 2013 paper, Cames and Helmers argued that Europe is probably worse off today, from a global warming perspective, than it would have been if automakers had just focused on improving gasoline-powered cars all along. And Europe is arguably much worse off than it would have been if automakers had started investing in hybrid electric technology back in the 1990s.

The authors offer up this chart, showing that Europe's diesel cars may have once had a sizable CO2 advantage over traditional gasoline vehicles. But today that gap has virtually disappeared, as new technologies like turbochargers have made gasoline engines nearly as efficient as diesel cars:

What's more, there are two subtle drawbacks to diesel engines that make them worse for global warming than they seem.

First, even if diesel cars emit less CO2 than gasoline vehicles, they emit a lot more black carbon, or soot, a pollutant that (we've recently learned) also contributes significantly to global warming. The precise accounting here is still subject to some dispute, but Cames and Helmers point out that black carbon emissions from diesel cars likely negate a big chunk of their CO2 advantage.

Second, remember that European countries encouraged diesel car adoption by slashing taxes on the diesel fuel itself (compared with gasoline). But as any Econ 101 student will tell you, cutting fuel prices gives people an incentive to drive more miles — and increase their overall emissions. This further chips away at any climate advantage diesel might have.

Add it up, and Cames and Helmers conclude that "the European diesel car boom did not cool down the atmosphere."

One final coda here. Go back and look at the Japanese cars on the graph above. Back in the late 1990s, Japanese automakers were also thinking about cutting CO2, but they figured that diesel was a dead-end technology, since the cost of cleaning up the extra NOx pollution would be too high. Instead, companies like Toyota started investing in hybrid vehicles, with the first Prius appearing in 1997. By contrast, Europe's automakers initially scoffed at electric powertrains, and none of them even bothered producing hybrids until Mercedes finally rolled one out in 2009.

Japan's decision now looks prescient, and Europe's looks shortsighted. Hybrids proved much greener: The newest Japanese cars now produce roughly 10 percent less CO2 per mile than Europe's diesel vehicles do, on average. And Japan's automakers appear to be better set

up for the future. Many experts now think that transportation will eventually have to become electrified if we want truly deep reductions in emissions. But European automakers, stuck on diesel for so long, are scrambling to catch up.

Europe is now struggling to undo its diesel mistake — but it's not easy

Debate Over Vehicle Emissions Intensifies As Volkswagen Scandal Widens

Because of the Volkswagen scandal, and the staggering levels of pollution in cities like Paris and London, Europe's policymakers are now beginning to rethink their fondness for diesel cars. But it's a hard technology to give up. Path dependency is a hell of a drug.

In diesel-loving France, Ségolène Royal, the environment minister, recently said that the country would consider phasing out preferential tax breaks for diesel over the next five years. "We need to start preparing our move out of diesel," she reportedly told France 5 television. But she's also bristled at any suggestion that France should act too quickly. After all, diesel cars still account for more than 60 percent of all European sales for Renault and Peugeot, two major local manufacturers. They can't just unwind those positions overnight.

Volkswagen, for its part, is also engaged in a bit of soul searching around diesel (at least, when it's not recalling its 11 million law-breaking diesel cars and dealing with criminal investigations). The company recently announced that it would take a major plunge into electric powertrains, creating a standardized architecture for a new wave of plug-in cars. "The Volkswagen brand is repositioning itself for the future," said executive Herbert Diess. Except, of course, this shift won't happen overnight. Because VW spent so many years dreaming up ways to evade regulators and sell diesel cars, it's now playing catch-up to electric car companies like Tesla.

In the meantime, Europe's smoggy cities still have to grapple with the fallout from all those polluting diesel cars that are still on the road — and will likely stick around for years. The EU has started to pressure countries with the worst air pollution. Cities like London, Stockholm, and Milan are already experimenting with emission-free zones. In the future, drivers with old diesel clunkers could have to pay extra to travel downtown in certain cities. But even this cleanup will take years.

Energy bets can sometimes go horribly wrong. So how do we avoid that?

Europe's misadventure with diesel cars is a great case study in how energy policy can go very badly awry, and no doubt there's a long list of lessons to draw. I'll just mention a few big ones:

First, Europe's complete failure to regulate diesel pollution is worth studying. Not only had regulators designed flimsy emissions tests — partly at the behest of industry lobbying — but it took two decades to even realize the tests were failing. Crafting ambitious environmental rules is all well and good, but without ample enforcement and monitoring, those rules are basically pointless. (Note that China is now pursuing ambitious climate policies of its own, but experts keep muttering that enforcement will be a big challenge — a caveat that deserves much more attention.)

Another possible takeaway is that if we really want to reduce greenhouse gas emissions from the transportation sector, liquid fuels are ultimately a dead end and electrification is the best path forward. There's no shortage of experts who believe that, and certainly that's the lesson Volkswagen seems to be drawing from this fiasco. That said, it's worth noting that Toyota, which was ahead of the pack in developing hybrid electrics in the late 1990s, actually doesn't believe electric cars are the future and is pouring R&D into hydrogen cars instead.

Which brings us to the third takeaway. The future is hard to predict. Diesel cars seemed like a reasonable idea in the 1990s and a disaster today. That suggests that policymakers should have a lot more humility when crafting energy policy. One approach might be to pursue more technology-neutral policies organized around preferred outcomes — say, tightly enforced standards that require lower emissions — rather than favoring specific industries just because they happen to seem promising at that moment in time.

This issue comes up again and again. For years, governments have been laying down big bets on emerging clean energy technologies. France did it with nuclear power in the 1970s and '80s. Germany did it with wind and solar power in the 2000s, through feed-in tariffs. The United States did it with corn ethanol in 2005.

Done right, this sort of government support can be valuable, helping useful new energy options break into the mainstream against entrenched competition. But the biggest risk is that governments end up gambling on badly flawed technologies that then become the entrenched competition and prove impossible to get rid of. The US arguably made that mistake with corn ethanol, which has had unintended ripple effects on the food supply and deforestation and is proving politically difficult to wind down. Now it's clear that Europe made that mistake, too.

Bourn v Volkswagen Complaint (Class Action).pdf

FILED

2015 OCT -6 P 5:00

CLERK US DISTRICT COURT
ALEXANDRIA, VIRGINIA

IN THE UNITED STATES DISTRICT COURT
FOR THE EASTERN DISTRICT OF VIRGINIA
Alexandria Division

MARIA BOURN, DAVID WATSON, STEPHEN VERNER, and MARK SCHUMACHER, on behalf of themselves and all others similarly situated,

Plaintiffs,

v.

VOLKSWAGEN AG, VOLKSWAGEN OF AMERICA GROUP, INC., VOLKSWAGEN OF AMERICA, INC., AUDI OF AMERICA, LLC, and AUDI AG,

Defendants.

Case No. 1:15cv1295

JURY TRIAL DEMANDED

LOG/MSN

CLASS ACTION COMPLAINT

Plaintiffs Maria Bourn, David Watson, Steven Verner, and Mark Schumacher bring this action on their own behalf and on behalf of a class of similarly situated persons against Volkswagen AG ("VWAG"), Volkswagen of America Group, Inc. and Volkswagen of America, Inc. (collectively, "VWoA"), and Audi of America, LLC and Audi AG (collectively, "Audi").[1] Plaintiffs seek injunctive relief and to recover damages caused by Volkswagen's violations of Section 2 of the Sherman Antitrust Act (15 U.S.C. § 2), the Racketeer Influenced and Corrupt Organizations Act ("RICO") (18 U.S.C. § 1961 *et seq.*), the Magnuson-Moss Warranty Act (15 U.S.C. § 2301 *et seq.*), the common law of fraud and unjust enrichment. and the statutory laws of California and Virginia. Plaintiffs make the following allegations upon information and belief,

[1] Unless otherwise indicated herein, all of these defendants will be referred to collectively as "Volkswagen."

VW FOIA, EPA 06/20/2017 2017-FFP_034200

except as to those allegations pertaining to the named plaintiffs, which are made on personal knowledge.

I. NATURE OF THE ACTION.

1. Four years ago, Martin Winterkorn ("Winterkorn"), Volkswagen's former Chief Executive Officer ("CEO"), announced Volkswagen's goal to become the world's largest automaker. "By 2018," he told U.S. politicians gathered for the opening of a Volkswagen plant in Chattanooga, Tennessee, "we want to take our group to the very top of the global car industry."[2] With only a relatively small share of the gigantic United States market, Winterkorn's ambitious plan required a dramatic increase in sales in that market. And the way to increase sales here, Volkswagen decided, was to convince American consumers that its diesel-powered cars were a superior alternative, with better fuel efficiency, lower emissions, and uncompromised performance.

2. Between 2009 and September 18, 2015, Volkswagen aggressively marketed its so-called Clean Diesel Turbocharged Direct Injection ("TDI") light passenger vehicles in the United States, spending millions of dollars on print, television, internet and point-of-sale advertising aimed at convincing American consumers that its cars were environmentally-friendly, fuel-efficient, powerful, and reasonably priced. In order to increase its market share, Volkswagen's cars needed all those attributes to win over a skeptical American public. Compared with Europe, with its higher fuel costs, expensive cars and less stringent tailpipe emission standards, the United States market was a tough sell for diesel-powered passenger cars.

3. Until September 18, 2015, it looked as if Winterkorn's ambitious plan had succeeded. In July of 2015, Volkswagen surpassed Toyota Corporation ("Toyota") as the world's largest automaker, selling 5.04 million vehicles in the first six months of this year, compared to

[2] http://www.nytimes.com/2015/09/27/business/as-vw-pushed-to-be-no-1-ambitions-fueled-a-scandal.html?_r=0.

VW FOIA, EPA 06/20/2017 2017-FFP_034201

Toyota's 5.02 million.[3]

4. As noted above, the United States was a key part of this global strategy. As reported in *Automotive News*:

> Back in 2007, the automaker vowed to crank up U.S. sales of its VW brand to 800,000 vehicles a year by 2018. It was a dizzying sum, requiring more than a tripling of its volume at that time. Many in the industry scoffed.
>
> But with steady precision, VW got the skeptics to take a second look. It launched a lower-priced, Mexico-made Jetta and built a plant in Chattanooga that began churning out a new Passat that better fit American tastes and budgets. VW sales doubled between 2009 and 2012, to nearly 440,000, lifting hopes that 800,000 was doable.[4]

By October 1, 2015, VWoA had reported sales of 264, 215 passenger vehicles in the United States through September 15, indicating that before the scandal that is the subject of this Complaint surfaced, it was expecting another excellent sales year.[5]

5. Unfortunately for American consumers, Volkswagen's success in capturing market share was based on a lie. On September 18, 2015, the United States Environmental Protection Agency ("EPA") and the California Air Resources Board ("CARB") both notified Volkswagen that it had violated federal and state laws and regulations by using a "defeat device"--software specifically intended to circumvent emission test procedures established by the EPA and by CARB. Those notices are attached as Exhibits 1 and 2 to this complaint.

6. Volkswagen's "defeat device" is a "sophisticated software algorithm"[6] that detects

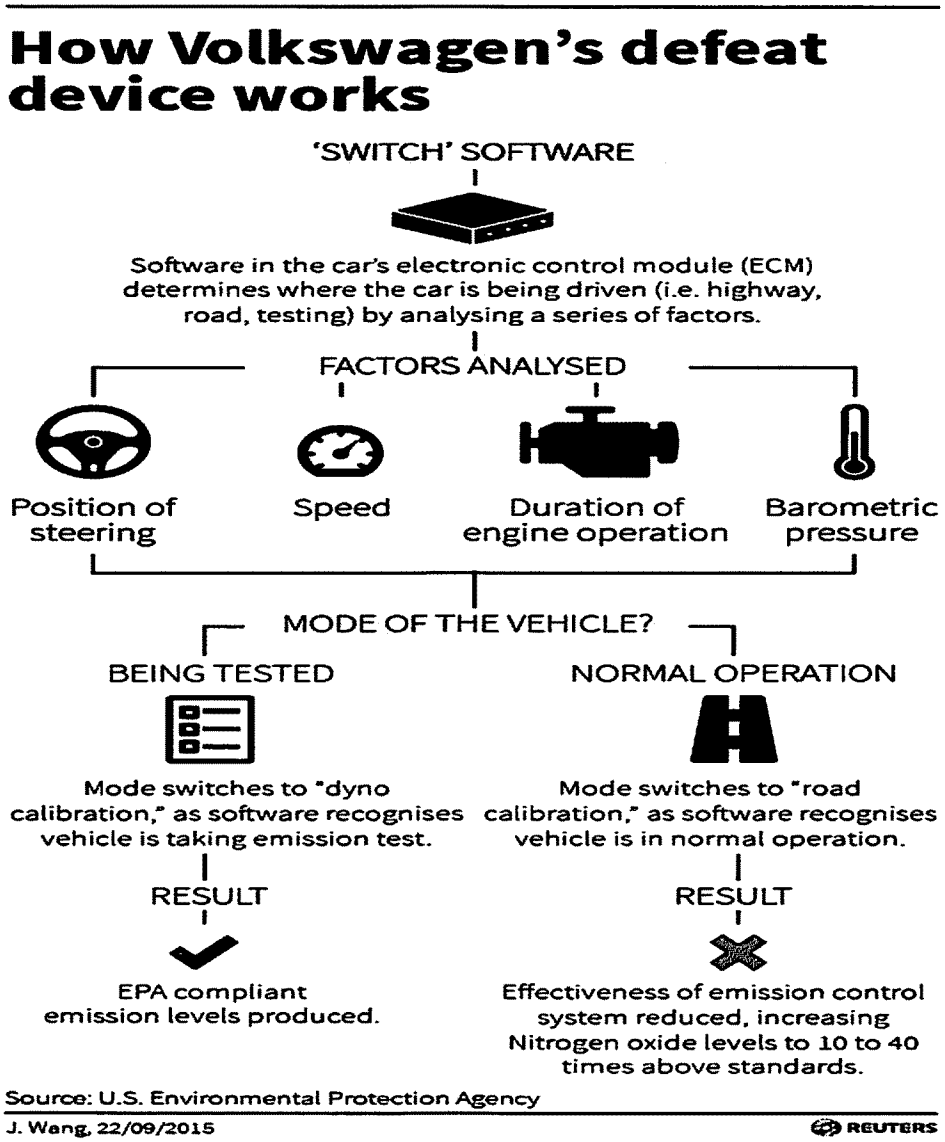
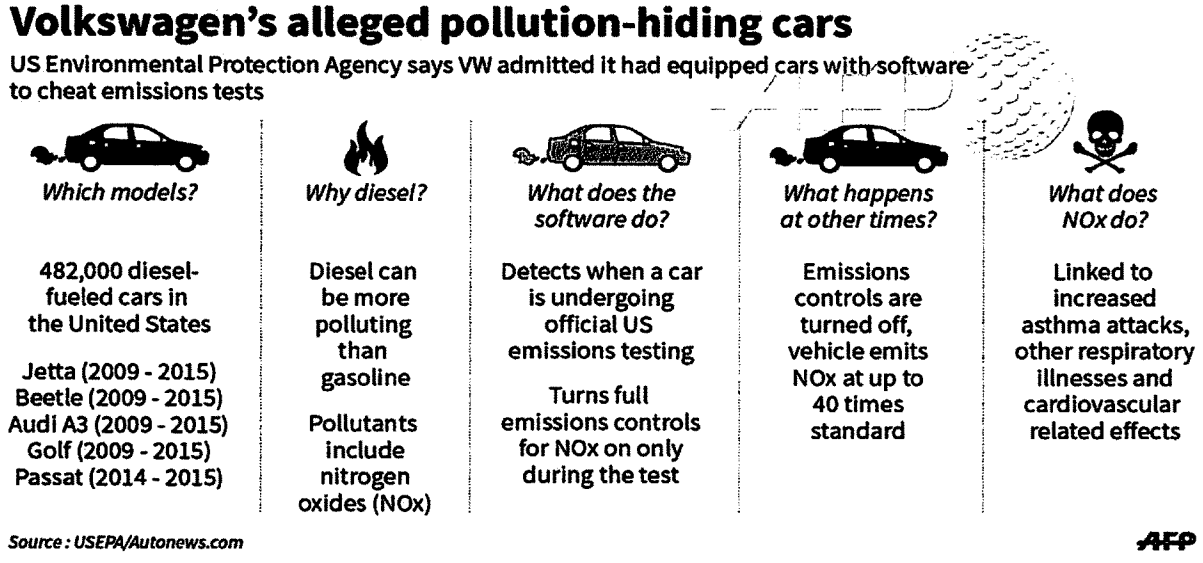
[6] http://www.theguardian.com/business/2015/sep/18/epa-california-investigate-volkswagen-clean-air-violations.

when the car is undergoing emissions testing. Under such laboratory test conditions, Volkswagen's vehicles pass the EPA and CARB emissions tests with flying colors. Under normal driving situations, however, the software algorithm ***turns off*** the emissions control systems, allowing the cars to spew as much as 40 times the allowable amount of pollutants--specifically nitrogen oxides ("NOx")--into the air. Elevated NOx contributes to the creation of ozone and smog, and is linked to asthma attacks, other respiratory diseases such as emphysema and bronchitis, and causes premature death. A diagram published in Reuters depicts its operation:



7. The chart below, published by *Agence France Press*, provides a useful and concise primer on the known facts:



8. As noted below, dozens of fatalities in the United States over the last seven years have been attributed to the illegal use of this "defeat device." The scandal has been popularly referred to as "Dieselgate."

9. Volkswagen has admitted to installing these "defeat devices" in 11 million diesel vehicles that have been sold around the world, including the 482,000 in the United States. As Michael Horn ("Horn"), the President and CEO of VWoA, candidly admitted: "[l]et's be clear about this. **Our company was dishonest. With the EPA, and the California Air Resources Board, and with all of you. And in my German words, we have totally screwed up.**"[7] (Emphases added). Horn further stated in a video on VWAG's website that **"[o]ur company**

[7] http://www.roadandtrack.com/new-cars/car-technology/news/a26774/volkswagen-ceo-we-screwed-up/. A YouTube video of this extraordinary concession can be found here: www.youtube.com/watch?v=Q6z8uUJE-jE.

betrayed the trust of you, our customers, our employees, our dealers and the public."[8] (Emphases added). And as VWAG has posted on its website: "[g]overnment regulations limit the use of engine software that reduces the effectiveness of a vehicle's emissions control systems. **Those are the 'defeat device' regulations, and regrettably, VW violated those regulations. We take full responsibility** – and deeply regret that this happened."[9] (Emphases added). In a September 23, 2015 press release available on VWAG's website, the Executive Committee of VWAG's Supervisory Board ("Board") stated: "[t]he Executive Committee takes this matter extremely seriously. **The Executive Committee recognizes not only the economic damage caused, but also the loss of trust among many customers worldwide.**"[10] (Emphases added). Or, as Berthold Huber ("Huber"), Deputy Chairman of the Board, was quoted as saying in a September 25 press release, **"[t]he test manipulations are a moral and political disaster for Volkswagen. The unlawful behavior of engineers and technicians involved in engine development shocked Volkswagen just as much as it shocked the public."** [11] (Emphases added).

10. In light of the scandal, VWAG's Board forced Winterkorn to resign as CEO of VWAG on September 23.[12] In doing so, he stated that "**I accept responsibility for the irregularities that have been found in diesel engines.**" (Emphases added). [13] He further observed

[13] http://www.nytimes.com/2015/09/24/business/international/volkswagen-chief-martin-winterkorn-resigns-amid-emissions-scandal.html. Notably, however, Winterkorn plans to stay as the Chairman of the Board of Directors of Porsche Automobil Holding SE, which owns a 52% controlling stake in VWAG; he is also still demanding payment of the ten million Euros owed to him under his employment contract, which does not expire until 2016.

that "**[m]illions of people across the world trust our brands, our cars and our technologies. I am endlessly sorry that we have disappointed this trust. I apologize in every way to our customers, to authorities and the whole public for the wrongdoing.**"[14] (Emphases added). He professed surprise that "**misconduct on such a scale**" (emphases added) occurred within the Volkswagen group, suggesting that he had no knowledge of it.[15] It has been reported that Winterkorn was being investigated for fraud in connection with the conduct at issue here by prosecutors in Lower Saxony; however, more recently, those prosecutors have stated that any prosecution will await further factual information.[16]

11. Volkswagen has ordered its authorized dealers ("Volkswagen Authorized Dealers") to cease selling the vehicles in which the defeat devices are installed. These include at least the VW Jetta TDI (Model Years 2009-15), the VW Jetta SportWagen TDI (Model Years 2009-14), the VW Golf TDI (Model Years 2010-15), the VW Golf SportWagen TDI (Model Year 2015), the VW Beetle TDI and VW Beetle Convertible TDI (Model Years 2012-15), the VW Passat TDI (Model Years 2012-15) and the Audi A3 TDI (Model Years 2010-15).[17] These affected vehicles will be referred to in this Complaint as the "Class Vehicles."

12. Volkswagen's internal investigation has resulted so far in the suspension of three

VW FOIA, EPA 06/20/2017 2017-FFP_034206

executives: (a) Heinz-Jakob Neusser ("Neusser"); (b) Ulrich Hackenberg ("Hackenberg"); and (c) Wolfgang Hatz ("Hatz").[18] Spiegel Online described Hackenberg's departure, which was also typical of the others: "[h]e received news of his immediate suspension from the personnel department and was asked to turn in his company phone and leave his office. He has also been told not to set foot on company premises."[19]

13. None of these people are mere obscure midlevel engineers. Hackenberg is a VWAG Board member for Technical Development.[20] The same Spiegel Online article described Hackenberg as "a long-time confidant of Winterkorn and, up until just a few days ago, one of the most powerful men at VW." Hatz is a Porsche AG ("Porsche") Board of Management member in charge of Research and Development and is additionally Head of Engines and Transmissions Development for the Volkswagen Group.[21] Neusser was responsible for engine development at Porsche commencing in 1998 and drivetrain development commencing in 2011; in October of 2012, he succeeded Hatz as Head of Powertrain Development at the Volkswagen Group.[22]

14. The same Spiegel Online article notes that Hans-Dieter Pötsch ("Pötsch"), the VWAG Finance Chief and Board Chairman of VWAG, may also be under investigation by regulatory authorities. As discussed below, Volkswagen told the EPA about the use of a defeat device on September 3, but disclosed it publicly only on September 20. "[T]he finance chief

[18] http://uk.reuters.com/article/2015/09/29/uk-volkswagen-emissions-idUKKCN0RS0U620150929.

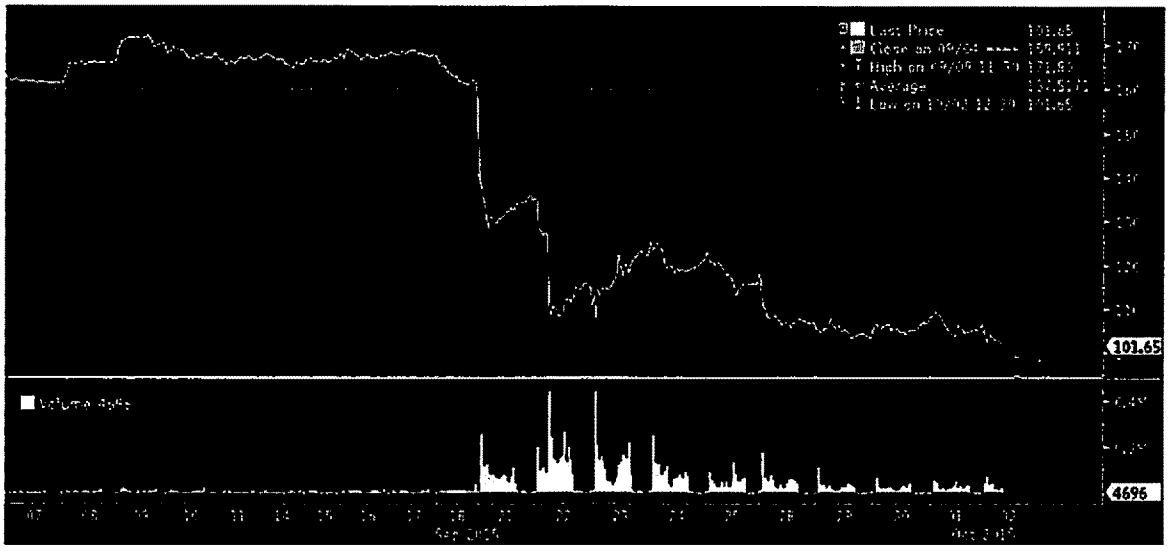
[19] http://www.spiegel.de/international/business/falsified-emissions-scandal-push-volkswagen-to-limits-a-1055897.html.

[20] http://www.audi.com/corporate/en/company/corporate-management/members-of-the-board/ulrich-hackenberg.html.

[21] http://press.porsche.com/more_about/executives/pag/hatz.php.

[22] http://www.volkswagenag.com/content/vwcorp/info_center/en/news/2012/09/Dr_Heinz_Jakob_Neusser.html.

remained silent for 17 days. During these 17 days, hundreds of thousands of investors bought VW stock. When the scandal was finally made public on Sept. 20, the price of VW shares plunged by 40 percent, costing stockholders €35 billion."[23] VWAG's shares have been on a steady decline ever since, as reflected in this graphic from the *Telegraph* in the United Kingdom:



15. According to an October 3 article from Reuters, "[a]t an internal company meeting this week at the VW headquarters in Wolfsburg, Pötsch described the situation as an 'existence-threatening crisis for the company', Germany's Welt am Sonntag reported in a release ahead of Sunday's publication."[24]

[23] http://www.spiegel.de/international/business/falsified-emissions-scandal-push-volkswagen-to-limits-a-1055897.html.

[24] http://mobile.reuters.com/article/idUSKCN0RX0GQ20151004. Pötsch's accession to the VWAG Board has been criticized. Hans-Christoph Hirt, a director of Hermes Equity Ownership Services, an adviser to pension fund investors in companies including Volkswagen, said the appointment created a "serious conflict of interest": "[Pötsch] was a key VW executive for more than a decade and under German law the management board has a collective responsibility . . . The lawyers will surely demand that he recuse himself from any supervisory board meetings when management's role is discussed."

16. As explained below, and contrary to the suggestions of some of Volkswagen's spokespersons, the unlawful conduct here was not the action of renegade lower-level employees. It was instead the product of a concerted scheme by top executives at Volkswagen to save costs through use of the TDI technology, break into the United States diesel passenger car market by concealing from regulators and the public the inability of cars using that technology to meet federal and state emissions standards, market the TDI cars through an elaborate seven-year long campaign of false advertising and lying to state and federal officials, and thereby obtain a monopoly share of the United States Clean Diesel passenger car market.

17. The German periodical *Bild am Sonntag* revealed that Robert Bosch GmbH ("Bosch"), the supplier of some components of the emissions control system, used by Volkswagen in TDI diesel vehicles, also supplied Volkswagen with diesel software for test purposes. Bosch reportedly told VWAG in 2007 that using that software in vehicles on the road would be illegal.[25] Similarly, *Süddeutsche Zeitung* has reported that Neusser had ignored least one Volkswagen engineer's warnings over "possibly illegal" practices in 2011.[26] Spiegel Online reported that groups within Volkswagen knew of potential issues as far back as 2005 or 2006.[27] Olaf Lies, a VWAG Board member, has stated publicly that **"[t]hose people who allowed this to happen, or who made the decision to install this software--they acted criminally. They must take personal responsibility**."[28] (Emphases added).

---

http://www.cnbc.com/2015/10/04/volkswagens-uniquely-awful-governance-at-fault-in-emissions-scandal.html.

18. As discussed in further detail below, Volkswagen has set aside the inadequate sum of 6.5 billion Euros (approximately $7.2 billion) to deal with the fallout from this fraud. Numerous countries across the world are investigating the matter and here, in the United States, probes are being conducted by the United States Department of Justice ("DOJ"), a coalition of state attorneys general ("AGs"), and members of the United States House of Representatives. The EPA has ordered a recall.

II. THE PARTIES.

A. Plaintiffs.

19. Plaintiffs Maria Bourn ("Bourn") and David Watson ("Watson") are residents of South San Francisco, California. Bourn is a lawyer in San Francisco. Watson is a teacher. In 2015, Bourn and Watson, who are married, purchased a certified, pre-owned 2010 Model Year Jetta SportsWagen from Stevens Creek Volkswagen in San Jose, California. Stevens Creek Volkswagen is a Volkswagen Authorized Dealer. Plaintiffs purchased the SportsWagen in reliance on Volkswagen's representations that the car was an environmentally-friendly "clean diesel" vehicle that was highly efficient, high-performance, and fun to drive. They would not have purchased the vehicle in the absence of Volkswagen's misrepresentations about the car's environmental impact, its fuel efficiency, and performance.

20. Plaintiff Mark Schumacher ("Schumacher") resides in Gainesville, Virginia. In 2012, he purchased a 2012 Model Year Volkswagen Passat SE TDI. Schumacher purchased the Passat from Lindsay Volkswagen in Sterling, Virginia. That company is a Volkswagen Authorized Dealer.Plaintiff Schumacher purchased the Passat in reliance on Volkswagen's representations that the car was an environmentally-friendly "clean diesel" vehicle that was highly efficient, high-performance, and fun to drive. He would not have purchased the vehicle in the absence of Volkswagen's misrepresentations about the car's environmental impact, its fuel efficiency, and performance.

21. Plaintiff Stephen Verner ("Verner") is an architect and resident of Oakland,

VW FOIA, EPA 06/20/2017 2017-FFP_034210

California. In 2013, he purchased a TDI Golf four door from Royal Motor Sales in San Francisco, California. Royal Motor Sales is an Authorized Volkswagen Dealer. Verner purchased the Golf in reliance on Volkswagen's representations that the car was an environmentally friendly "clean diesel" vehicle that was highly efficient, high-performance, and fun to drive. He would not have purchased the vehicle in the absence of Volkswagen's misrepresentations about the car's environmental impact, its fuel efficiency, and performance.

B. Defendants.

22. Defendant VWAG is a car corporation organized and existing under German law, with its principal place of business in Wolfsburg, Germany. VWAG is the parent company of Defendants VWoA and Audi.

23. Defendant Audi AG is a car corporation organized and existing under German law, with its principal place of business in Ingolstadt, Germany. Audi was created when VWAG merged two of its companies, Auto Union and NSU Motorenwerke AG. Audi is a 99.55%-owned subsidiary of the Volkswagen Group. Audi is now Volkswagen's luxury vehicle brand, and uses the slogan "Truth in Engineering".

24. Defendant the Volkswagen Group of America, Inc. is a corporation organized and existing under New Jersey law. Its headquarters are in Herndon, Virginia. The Volkswagen Group of America, Inc. is a wholly-owned subsidiary of VWAG. It is one of the world's largest producers of passenger cars. It sells the Beetle, Beetle Convertible, CC, Eos, e-Golf, Golf, Golf GTI, Golf SportWagen, Jetta, Passat, Tiguan, and Touareg vehicles through Volkswagen Authorized Dealers located in the United States. Volkswagen Group of America, Inc.'s operations in the United States include research and development; parts and vehicle processing; parts distribution; sales, marketing and service offices; financial service centers; and manufacturing.

25. Defendant Volkswagen of America, Inc. is owned and operated by the Volkswagen Group of America, Inc. and sells Volkswagen vehicles in the United States. Its United States headquarters are at the same address as Volkswagen Group of America, Inc. in Herndon, Virginia.

VW FOIA, EPA 06/20/2017 2017-FFP_034211

26. Defendant Audi of America, LLC is a subsidiary of Audi AG that sells Audi vehicles in the United States. Its United States headquarters are at the same address as Volkswagen Group of America, Inc. in Herndon, Virginia.

III. JURISDICTION AND VENUE.

27. This Court has jurisdiction over this action pursuant to 28 U.S.C. §§ 1331, 1332(d), 1337(a) and 1367. This court also has supplemental jurisdiction pursuant to 28 U.S.C. §1367(a).

28. Venue is proper in this judicial district and in the Alexandria Division thereof pursuant to 15 U.S.C. §§ 15 and 22, and 28 U.S.C. § 1391(b) and (c), in that at least one of the Defendants resides in this judicial district, is licensed to do business or is doing business in this judicial district.

IV. TRADE AND COMMERCE.

29. Approximately 482,000 Class Vehicles have been sold or leased in the United States in a continuous and uninterrupted flow of interstate commerce and foreign commerce during the last seven years, including through and into this judicial district. The business activities of the Defendants substantially affected interstate trade and commerce in the United States and caused antitrust injury in the United States.

V. FACTUAL ALLEGATIONS.

A. Automobile Emissions Regulations in the United States.

30. Congress enacted the first major Clean Air Act ("CAA") and established the EPA in 1970. The CAA, amended in 1975 and 1990, requires vehicle manufacturers to certify to the EPA that their cars and trucks will meet applicable federal emission standards.[29] The EPA administers a certification program to ensure that every vehicle complies with its emission standards. EPA-issued certificates of conformity are required for every vehicle sold in the United States, and the EPA must approve every vehicle entering United States commerce. In these

[29] http://www2.epa.gov/laws-regulations/summary-clean-air-act.

VW FOIA, EPA 06/20/2017 2017-FFP_034212

certification efforts, the EPA relies on test data submitted by automobile manufacturers, which submit the vehicles to the agency's testing procedures in their own laboratories. The EPA audits a small fraction of the new vehicles each year to ensure compliance.[30]

31. The Class Vehicles, like any other car sold in the United States, were required to satisfy emission standards for certain air pollutants, including NOx. 40 C.F.R. §86.1811-4; Clean Air Act §101(b)(1) – (2), 42 U.S.C. §7401(b)(1)(2).

32. Section 203(a)(3)(b) of the CAA prohibits the manufacture, selling, or installation of any device that bypasses, defeats or renders inoperative a required element of a vehicle's emissions control system. 42 U.S.C. §7522(a)(3)(b). Section 203(a)(10 of the same statute also prohibits the sale of motor vehicles or engines that are not covered by valid certificates of conformity with applicable emissions standards. 42 U.S.C. §7522(a)(1). The regulatory requirements for defeat devices are set forth in 40 C.F.R. Part 86.

33. The EPA has been rigorous in punishing automobile manufacturers or engine makers that utilize defeat devices. For example, in late 1995, it entered into a $45 million dollar settlement with General Motors Corporation regarding the use of defeat devices on 470,000 Cadillac cars.[31] Likewise, in August of 1998, it fined Honda $267 million and Ford $7.8 million for selling vehicles equipped with defeat devices that prevented emission control systems from working properly.[32] Similarly, in October of that year, it and the DOJ fined seven truck and heavy duty equipment manufacturers $83.4 million for engaging in similar conduct.[33]

---

[30] http://www.autonews.com/article/20151004/OEM11/310059955/vw-emissions-violations-put-self-certification-under-new-scrutiny.

[31] http://www.autosafety.org/sites/default/files/imce_staff_uploads/Cadillac%20%2445%20Million%20Defeat%20Device%20Penalty%2011-31-95.pdf.

[33] http://www2.epa.gov/enforcement/cummins-engine-company-diesel-engine-clean-air-act-settlement.

VW FOIA, EPA 06/20/2017 2017-FFP_034213

34. Volkswagen was or should have been aware of these precedents. Indeed, the company itself is a recidivist violator of the CAA. In July of 1973, the EPA referred to DOJ for legal action a claim that defeat devices were installed on 1973 Volkswagens. A copy of that referral is attached as Exhibit 3 to this complaint. The matter was settled for $120,000 in March of 1974.[34] Similarly, in June of 2005, Volkswagen entered into a consent decree with DOJ whereby it paid a $1.1 million penalty concerning its failure to notify the EPA of emissions defects in certain vehicles manufactured at its facility in Mexico.[35] A copy of that decree is attached as Exhibit 4 to this Complaint.

35. CARB is a department of the California Environmental Protection Agency. It was created in 1967. California is the only state permitted to have such a regulatory agency, because it was created prior to the enactment of the CAA. CARB's mission is to "[t]o promote and protect public health, welfare and ecological resources through the effective and efficient reduction of air pollutants while recognizing and considering the effects on the economy of the state."[36]

36. The EPA introduced phased in Tier 2 emissions standards from 2004 to 2009. California has similar standards in its CA LEV II standard. The Tier 2 Bin rating system applied to all passenger vehicles regardless of fuel type. Tier 2 Bin 5 standards--the ones applicable to the Class Vehicles--imposed an emission rate for NOx of 0.07 grams per mile.[37]

37. New cars that are sold bear stickers indicating that they are EPA-and/or CARB compliant. Here is a photograph of such a sticker on the inside of the hood of a TDI Audi A3, one of the Class Vehicles.

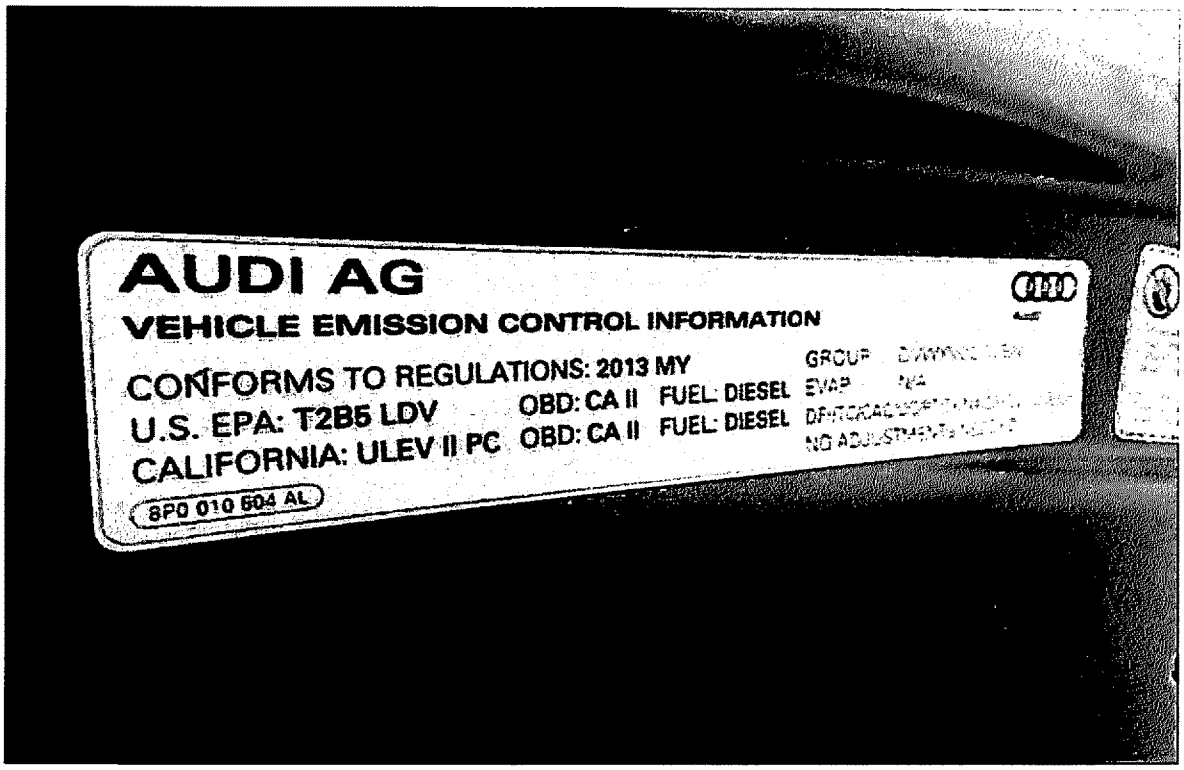
---

[34] http://www.autosafety.org/sites/default/files/imce_staff_uploads/VW%20Defeat%20Device%20%24120%2C00%20fine%203-12-74%20Pr.pdf.

[35] http://www.autosafety.org/sites/default/files/imce_staff_uploads/volkswagen-cd.pdf.

[36] http://www.arb.ca.gov/html/mission.htm.

[37] http://www.nctcog.org/TRANS/air/vehicles/tech/compliance/index.asp.

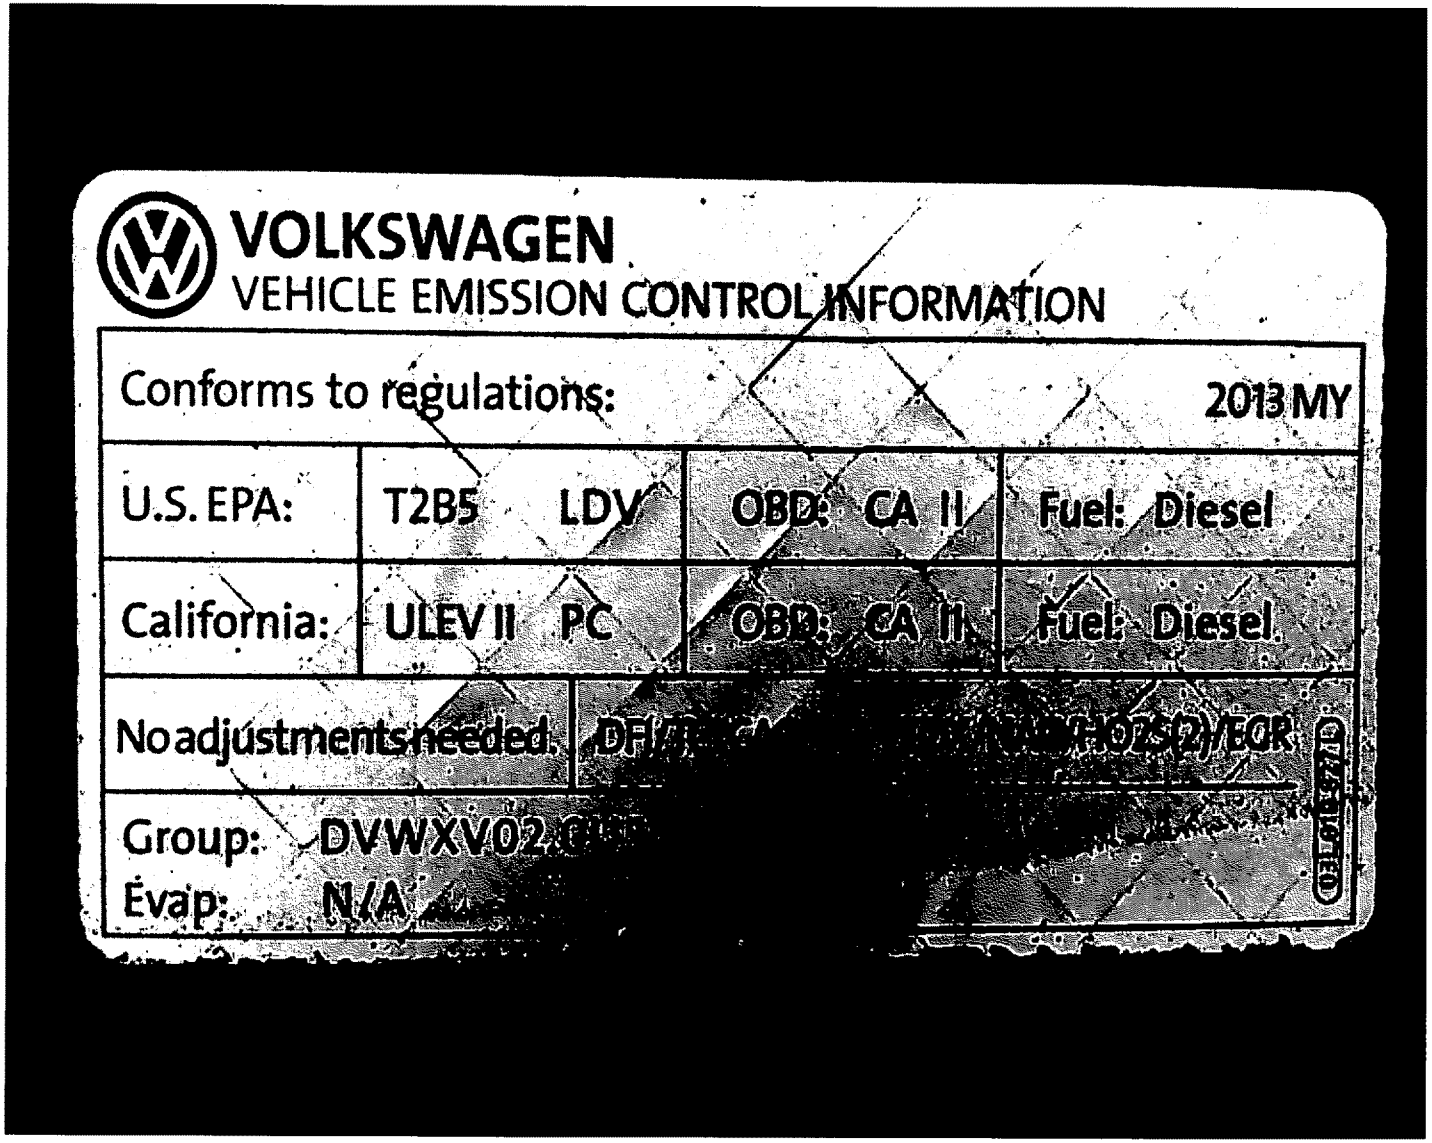


And here is a similar sticker for a 2013 TDI Volkswagen Golf:

//

//

//



VOLKSWAGEN
VEHICLE EMISSION CONTROL INFORMATION

Conforms to regulations:			2013 MY
U.S. EPA:	T2B5 LDV	OBD: CA II	Fuel: Diesel
California:	ULEV II PC	OBD: CA II	Fuel: Diesel
No adjustments needed.	DPF/	HO2S(2)/EGR	
Group: DVWXV02			
Evap: N/A			

Through these types of notice, Volkswagen was representing to customers that the Class Vehicles complied with federal and state emissions laws. This was an outright lie.

B. Diesel Cars And Control of NOx Emissions.

38. Diesel-powered cars, like gasoline-powered cars, must also meet the emissions standards established by the EPA and CARB. With diesel-powered engines, car manufacturers must use different--and more expensive--emission control systems than are used in gasoline-powered cars.

39. Diesel fuel has a greater energy density than gasoline. It converts heat into energy more efficiently than gasoline, sending less heat out of the tailpipe than gas-powered vehicles. Because it has greater energy density, diesel also is more efficient: diesel vehicles can get up to 30% more miles per gallon than similar gasoline-powered cars. In addition, because of their higher compression, diesel engines can generate a lot of torque, providing strong acceleration and additional power needed for towing.

40. While diesel vehicles have certain advantages over gasoline, they also have some disadvantages. Because diesel fuel is heavier and oilier than gasoline, it can generate more pollution. While diesel engines emit lower amounts of carbon monoxide than gasoline-powered engines, they emit more NOx.

41. Diesel fuel exhaust has been recognized by the World Health Organization to be a carcinogen for humans.[38]

42. Automakers have faced significant challenges in controlling NOx emissions sufficiently to meet environmental standards, particularly with smaller vehicles, and particularly in the United States, which has some of the strictest emission controls in the world. The website of greencongress.com explains the two types of approaches diesel automobile manufacturers have used to deal with NOx emissions:

[38] http://www.iarc.fr/en/media-centre/pr/2012/pdfs/pr213_E.pdf.

VW FOIA, EPA 06/20/2017 2017-FFP_034217

> Broadly, there have been two catalytic approaches used to reduce exhaust NO_x: urea-based selective catalytic reduction (SCR) and lean NO_x trap (LNT) catalysts.
>
> --The urea-SCR (urea=AdBlue) approach requires on-board storage of the reductant fluid which is introduced into the exhaust upstream of the SCR catalyst. It is then converted to ammonia which interacts with NO_x on the SCR catalyst to form water and nitrogen.
>
> --LNT technology utilizes fuel from the vehicle and advanced engine controls to enable periodic operation of the engine at rich air-to-fuel ratios to produce oxygen-depleted exhaust suitable for reducing NO_x stored on the LNT catalyst surface.[39]

43. The article indicates that Volkswagen had planned to use both technologies as of 2007, but elected to go with the LNT approach (which it referred to as TDI). As explained below, the deciding factor was apparently cost. Because of the extra equipment (including a urea tank) and technology required to clean the NOx emissions from the diesel exhaust, SCRs can add significantly to the cost of producing the engine. They also make diesel cars heavier than they otherwise would be, thus potentially decreasing fuel efficiency, torque and power.

44. Honda, which sells diesel cars in markets other than the United States, never tried to sell them here. That is because, according to Honda's research, "[t]he market would not bear the costs of doing diesel correctly." In order to meet the stringent United States emissions standards, Honda would have had to add costly emissions controls to every diesel model, which would make them more expensive than gasoline-powered competitors. "At such a high premium, customers simply wouldn't buy them."[40]

C. Volkswagen's Decision To Use TDI Technology.

45. Volkswagen has been selling cars in the United States since 1949, when it introduced the iconic Volkswagen Beetle. Although it was for many years the top-selling imported car in the United States, Japanese imports overtook Volkswagen and other European imports in

---

[39] http://www.greencarcongress.com/2015/09/20150921-vw2l.html.

[40] http://mashable.com/2015/09/27/vw-dieselgate/#2VosDbcL7iqT.

the 1990s.

46. The decisive factor in the decision to use TDI technology in 2007-08 was the appointment of Winterkorn as CEO of VWAG in January of 2007. Winterkorn was involved in overseeing research and development and had that responsibility at the time he resigned as CEO. In 1995, he took over as the head of Volkswagen Group Product management and a year later, he assumed the role of Member of the Board of Management for "Technical Development" at the Volkswagen brand. He assumed a similar role when he became Chairman of the Board of Management at Audi.[41]

47. Before Winterkorn took over as VWAG's CEO on January in 2007, Volkswagen had partnered with Bosch and Daimler to explore the use of a diesel emissions control system called BlueTec.[42] BlueTec was a technology developed by the latter two companies and championed by Wolfgang Bernhard ("Bernhard"), former head of the Volkswagen brand and a former Daimler executive. BlueTec was an SCR technology; it required the use of a liquid urea tank, so that urea could be sprayed onto the emissions in order to neutralize the NOx. The urea tank not only takes up space and adds weight (disadvantages that are especially acute in the market for small, fuel-efficient cars), but also requires the owner to refill the tank, making the diesel engine more inconvenient than a traditional gasoline-powered car. When Bernhard left the company after Winterkorn took control, the BlueTec technology was scrapped for smaller vehicles. Volkswagen only began using a form of SCR technology on a few of its smaller vehicles in 2012.

48. *Automotive News* describes the sequence of events:

> *Bild am Sonntag* said the roots of the crisis were planted in 2005 when then-VW brand Chief Wolfgang Bernhard wanted VW to

---

[41] *See* http://www.volkswagenag.com/content/vwcorp/content/en/the_group/senior_management/winterkorn.html.

[42] For the source of this information, *see* http://www.nytimes.com/2015/09/27/business/as-vw-pushed-to-be-no-1-ambitions-fueled-a-scandal.html?_r=0.

VW FOIA, EPA 06/20/2017 2017-FFP_034219

> develop a new diesel engine for the U.S. market. Bernhard recruited Audi engineer Rudolf Krebs who developed a prototype that performed well in tests in South Africa in 2006, the paper said.
>
> Bernhard and Krebs argued that the only way to make the engine meet U.S. emission standards was to employ in the engine system an AdBlue urea solution used on larger diesel models such as the Passat and Touareg, according to the report.
>
> This would have added a cost of 300 euros ($335 in today's U.S. dollars) per vehicle -- a sum that VW finance officials said was too much at a time when a companywide cost-cutting exercise was under way.
>
> Bernhard left VW in January 2007 before the diesel engine went into production. Krebs was moved to another role when Martin Winterkorn became VW Group and brand CEO in 2007.
>
> Winterkorn, Audi's former CEO, asked Audi development boss Ulrich Hackenberg and Audi engine boss Wolfgang Hatz to move to VW's Wolfsburg headquarters and continue development work on the engine, *Bild am Sonntag* said.
>
> The engine then ended up in VW Group diesels with its engine software manipulated to fool diesel emissions tests in the U.S.[43]

Hatz and Hackenberg, as noted above, were two of the executives whom VWAG recently suspended.

49. Engineers at Volkswagen had been looking at an alternative to BlueTec technology, an alternative that ultimately evolved into the TDI "Common Rail" system. In 2006, Richard Dorenkamp, head of Volkswagen's diesel engine development, gave a presentation in Detroit. He described the TDI system Volkswagen engineers developed and how it could be used in small cars and meet increasing US demands for fewer emissions.[44] Volkswagen's TDI Clean Diesel pollution

---

[43] http://www.autonews.com/article/20150927/COPY01/309279989/bosch-warned-vw-about-illegal-software-use-in-diesel-cars-report-says. Winterkorn was generally very concerned about the costs associated with developing eco-friendly automotive engines. As he said at the 2014 Paris auto show, "[c]limate protection is not available free of charge. Every gram of reduction in [tailpipe] C02 costs us 100 million euros. Every gram!" http://blog.caranddriver.com/vws-winterkorn-to-greens-so-get-off-our-backs-already/.

[44] http://www1.eere.energy.gov/vehiclesandfuels/pdfs/deer_2006/session7/2006_deer_dorenkamp.pdf.

control technology differed from the SCR technology used by other manufacturers to control NOx emissions. The greencarcongress.com article cited earlier describes it in detail. Instead of having a urea tank, the TDI Clean Diesel cars technology used a trap to collect NOx. While saving the space, weight and cost required by the urea tank in the SCRs, Volkswagen's TDI Clean Diesel technology--when it was operational--required additional use of fuel, thus degrading both gas mileage and performance. The trap was controlled by a computer module that could save fuel by allowing more pollutants to pass through the exhaust system.

50. In June of 2007, six months after Winterkorn took over as CEO of VWAG, Volkswagen issued a report entitled "Power Train and Fuel Strategy--The Path To The Future."[45] It stated:

> In the first stage on the path to this independence, it will be important to utilize existing fossil fuels as efficiently as technically possible. Volkswagen is putting its stamp on this phase with vehicles such as the BlueMotion models, a universally fuel-efficient fleet of TDI engines, highly efficient and unique TSI engines, successful natural gas vehicles (EcoFuel) and a lineup of models that still leaves room for automotive dreams. Very soon these fundamental technologies will be further refined. **New powertrains, including an engine concept developed for use in the USA, under the working title "BlueTDI", are already in the prototype stage. These engines will fulfill the toughest emissions laws in the world – even the so-called "Tier2 Bin5" in California, one of the most stringent emissions standards in the world.** (Emphases added).[46]

51. Volkswagen had planned to introduce the Jetta TDI Clean Diesel in the United States earlier than it eventually did. In November of 2007, it was reported as follows:

---

[45] It can be found at http://www.volkswagenag.com/content/vwcorp/info_center/en/themes/2007/06/powertrain_and_fuel_strategy.html.

[46] In 2008, five VWAG engineers published a two-part article in the May and June issues of *MTZ* magazine saying they had resolved the issue of how to best control emissions and could now meet California standards through the use in part of a new on-board diagnostics system. Similarly, Achim Freitag, a testing engineer in Volkswagen's diesel development department, touted the new engine in a speech given later that year. *See* http://www.pbs.org/wgbh/nova/next/tech/volkswagen-diesel-emissions/.

VW FOIA, EPA 06/20/2017 2017-FFP_034221

> A problem with the emissions system in Volkswagen's new Jetta TDI will delay the launch of the diesel sedan for about six months. The car is critical to VW's plans to get back on track in the United States.
>
> VW spokesman Keith Price confirmed that the delay will be announced this week at the Los Angeles auto show. Price would not give specifics about the technical problem, but he said it has been fixed.
>
> The technical changes engineers made to solve the problem mean the car must go through emissions testing and validation again, Price said.
>
> VW dealers have been without a new diesel car to sell since last spring. Production of the new model, which will be sold in all 50 states, was scheduled to start in January. The car will be built in Puebla, Mexico.
>
> U.S. sales originally were expected to begin in early spring, Price said. Now sales won't start until later in the summer."
>
> "Sure, they're disappointed," Price said of dealers who have learned of the delay.
>
> Price said there is a lot of pent-up demand from loyal VW diesel buyers for the next- generation Jetta, which has a new engine built in Germany and a new diesel fuel injection system.
>
> "They're disappointed, but they see the point that this car has to be perfect," Price said of the dealers, adding, "They recognize the importance of this not only for their stores, but for the VW brand."
>
> A fleet of about 40 Jetta TDIs is undergoing testing as part of the validation procedure.[47]

52. What apparently happened is that the TDI technology failed initially to withstand United States emissions testing. The decision was made to delay the launch of the vehicle and activate the algorithm that functioned as a defeat device in the software management system. This is consistent with the timing of the letter from Bosch described above that raised the illegality of such a tactic. It is also consistent with recent revelations that appeared in the October 4 issue of *Bild am Sonntag*:

---

[47] http://www.cleanmpg.com/forums/showthread.php?t=7254.

> An internal review at Volkswagen AG shows the decision to install software that reduces diesel emissions in testing was made just before serial production of the company's EA 189 engine [used in many of the Class Vehicles], German tabloid Bild am Sonntag said.
>
> Bild said the software was first installed in its diesel engines in 2008, shortly before the EA 189 was mass produced. The move was taken because there was no way at the time to reconcile meeting emission standards within the targeted cost of the engine, the tabloid said in an advance release of the article to be published Sunday. Otherwise the company would have had to abandon the introduction of the engine, development of which was begun in 2005, the newspaper said.[48]

53. The 2009 Model Year TDI Jetta was introduced and passed the Tier 2 Bin 5 emissions test with flying colors. A Reuters article describes its successful launch:

> Volkswagen had heavily marketed what it called "clean diesel" engines starting in 2008 with the 2009-model Jetta TDI. It appeared to have found a sweet spot between high-performance and fuel-efficiency with a zippy, fun-to-drive car that topped 40 miles per gallon in highway driving. Named "Green Car of the Year" at the Los Angeles auto show in 2008, the Jetta TDI was seen as a breakthrough in a country where diesel passenger cars occupy a tiny niche compared with Europe, where they are about half of the market.
>
> "It's not your grandfather's diesel," Krause said in a September 2008 presentation to U.S. regulators, according to a video of the remarks.
>
> [Norbert] Krause [head of VWoA's environmental office until 2009] and other VW officials promised a diesel that would meet pollution laws in all states, including California where diesel engines had long been associated with smog and cancer-causing soot.
>
> By that point, VW and other automakers had lobbied for almost a decade for regulators to give diesel another chance. In 2000, VW and other companies with an interest in promoting diesel, including Mazda, formed the Diesel Technology Forum to lobby for increased use in the United States as a way to reduce reliance on imported oil. In 2005, an energy bill signed by President George W. Bush offered tax credits for diesel buyers. That gave the first wave of diesel Jetta buyers an income tax credit of $1,300 each.

[48] http://www.marketwatch.com/story/vw-began-using-emissions-software-in-2008-report-2015-10-04.

> In 2009, after the new Jetta went on sale, VW dealers initially sold out, including in California where regulations had effectively shut the market to diesels earlier in the decade.[49]

54. As noted in the article, *Green Car Journal* gave it the 2009 Green Car of the Year award and gave the TDI Audi A3 the 2010 Green Car of the Year Award.[50] Those awards have been rescinded in light of the present scandal.[51] The TDI Clean Diesels were a resounding success and VWoA sold many units.[52] As recently as its 2014 sustainability report, VWAG crowed about how "[t]he Volkswagen Group has a long tradition of resolute commitment to environmental protection" and how it intended to "put our creative powers to good use for the benefit of the people and the environment."[53]

55. At conferences and in published papers, Volkswagen extolled the efficiency and low emissions of its Clean Diesel technology.[54] And commentators agreed. One stated that Volkswagen was "the only company to have mastered the new emissions regulations using a compact, inexpensive treatment system. It allowed them to roll out diesel engines in one small car after another at relatively low prices."[55] Volkswagen's competitors had long wondered how Volkswagen could produce a clean diesel engine at such an affordable price. As Robert Lutz,

[55] http://www.pbs.org/wgbh/nova/next/tech/volkswagen-diesel-emissions.

former vice chairman of General Motors Corporation, recounted: "I kept asking our engineers: 'What's wrong with you guys? VW seems able to do it.' I said, 'Are they magicians or something?' The engineers said they couldn't answer that question."[56] Now, they have their answer. Volkswagen cheated.

56. The competitive advantages of cheating on emissions have now become clear. "Manipulating emissions results allowed Volkswagen to keep down engine costs in a 'clean diesel' strategy that was popular in Europe and at the heart of a drive to improve U.S. results."[57] As an article in the *New York Times* put it, "[d]isabling the emissions controls brought major advantages, including much better mileage--a big selling point in Volkswagen's push to dominate in America."[58] These sales were part of the reason VWAG was able to surpass Toyota as the world's biggest automaker in 2015, as noted above. And they were sales built upon lies.

57. This systemic attitude of winning at all costs in spite of noncompliance with national environmental regulations is part of the corporate culture of Volkswagen, as explained at length in a September 24, 2015 *New York Times* article:[59]

> There is a long tradition of scandal and skulduggery in the auto industry, but few schemes appear as premeditated as Volkswagen's brazen move to use sophisticated software to circumvent United States emissions standards.
>
> That such a thing could happen at Volkswagen, Germany's largest company and the world's largest automaker by sales — 202.5 billion euros last year — has mystified consumers and regulators around the world. But given Volkswagen's history, culture and

[59] http://www.nytimes.com/2015/09/25/business/international/problems-at-volkswagen-start-in-the-boardroom.html?_r=1.

corporate structure, the real mystery may be why something like this didn't happen sooner.

"The governance of Volkswagen was a breeding ground for scandal," said Charles M. Elson, professor of finance and director of the John L. Weinberg Center for Corporate Governance at the University of Delaware. "It was an accident waiting to happen." The company, founded by the Nazis before World War II, is governed through an unusual hybrid of family control, government ownership and labor influence. Even by German standards, "Volkswagen stands apart," said Markus Roth, a professor at Philipps-University Marburg and an expert in European corporate governance. "It's been a soap opera ever since it started."

****

I spoke this week to a longtime former senior Volkswagen executive, who agreed that a scandal, especially one involving emissions, was all but inevitable at Volkswagen. He cited the company's isolation, its clannish board and a deep-rooted hostility to environmental regulations among its engineers.

The former executive, who spoke on the condition of anonymity because he now works at a competing global automaker, said that Wolfsburg, where Volkswagen is based in Lower Saxony and the city with the highest per capita income in Germany, is even more remote and isolated than Detroit was in its heyday. "The entire economy is automotive," he said. "People have a completely uncritical view of cars and their impact on the environment because they all make a living from the industry."

****

The Volkswagen board has been especially slow to move on environmental issues, investing less in electric and hybrid engine technology than industry leaders.

"There's an attitude among the German public that it's very unfair for the U.S. to target the auto industry over emissions," Professor Roth said. "If you have electric cars and a coal-fired plant producing the electricity, you gain nothing."

The former Volkswagen executive said Volkswagen's engineer-driven culture takes the notion even further. He said the engineers felt that the politicians were guilty of rank hypocrisy, especially in the United States, also grumbling that electric cars make no sense as long as power plants are burning fossil fuels.

"There's an attitude of moral superiority there," he said. "The engineers think they know best."

That Volkswagen is nonetheless obliged to obey applicable

> environmental laws, he said, is a notion likely to fall on deaf ears in Wolfsburg, especially compared to demands to be No. 1 in sales. (The motive for the software evasion is widely believed to have been to increase sales of diesel-powered cars in the United States.)

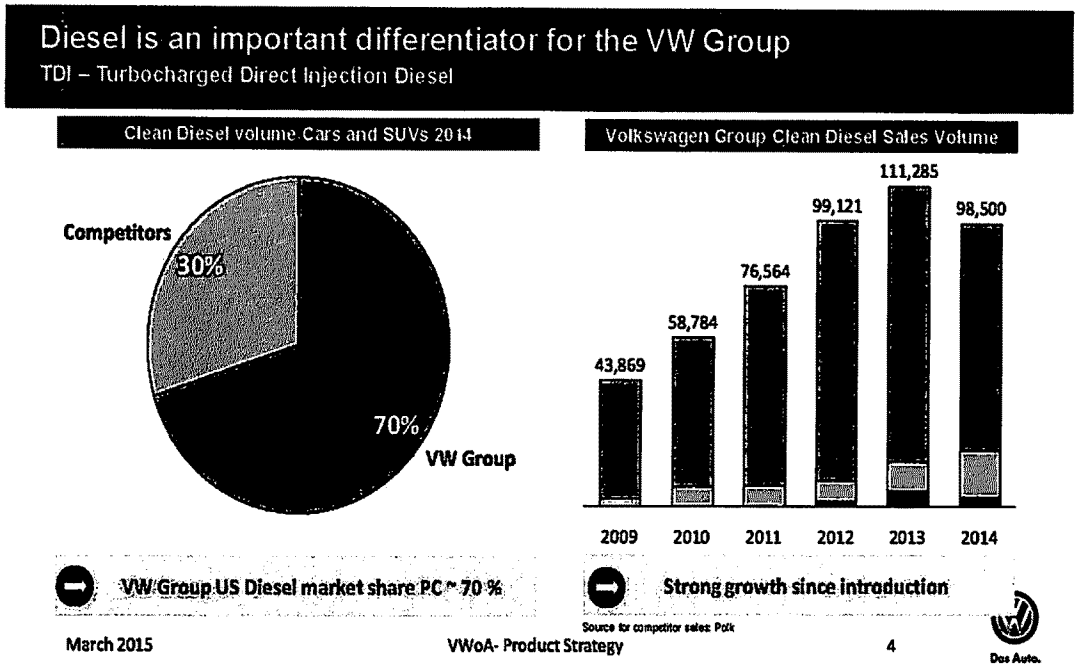
Thus, executives and engineers at Volkswagen were clearly unhappy with United States automotive emissions standards and were all too willing to sacrifice those standards (and their obligations under United States antitrust laws) in order to ensure that their company became the number one automaker in the world. The current scandal involving Volkswagen Clean Diesel TDI vehicles is a direct result of that arrogant intention to flout United States environmental laws. It is also a direct result of what has been described by one German executive as Volkswagen's "uniquely awful" corporate governance.[60]

D. The Clean Diesel Car Market.

58. Volkswagen's illegal conduct in this country occurred in the Clean Diesel passenger car market in the United States (the "Clean Diesel Car Market"), which can be viewed as a market of its own or as a submarket of passenger cars sold in this country. This fact was confirmed in a presentation by Douglas Skorupski ("Skorupski"), Manager of Power Train Strategy for VWoA, given to the Diesel Technology Forum ("DTF") in March of 2015:

[60] http://www.cnbc.com/2015/10/04/volkswagens-uniquely-awful-governance-at-fault-in-emissions-scandal.html.

VW FOIA, EPA 06/20/2017 2017-FFP_034227



59. Thus, VWoA clearly views clean diesel cars as a distinct market and Volkswagen's TDI technology as a factor that allowed it to obtain a monopoly share of that market.[61] It distinguished Clean Diesel cars from gasoline/electric hybrid cars based on superior performance:

[61] The presentation can be found at http://cleandieseldelivers.com/media/Douglas-Skorupski-VWoA_DTF_March2015.pdf. Bosch has similarly identified a distinct Clean Diesel car category: http://www.low-carbonfuels.com/pdfs/acte2011presentations/Day1/Breakout1/LightDuty/ACT2011-Breakout1-FreitagAlexPresentation150.pdf. And the EPA has noted that "Clean diesel" refers to a three-part emissions control system that combines cleaner diesel fuel, advanced engines and effective emissions control technology.

"[o]ne way Volkswagen aimed to achieve its lofty goal was by betting on diesel-powered cars — instead of hybrid-electric vehicles like the Toyota Prius--promising high mileage and low emissions without sacrificing performance."[62] Similarly, a survey conducted by Strategic Vision for Volkswagen found that customers of diesel and hybrid vehicles are very different and there is "very little crossover from one to the other." [63] The same article noted that Clean Diesel TDI and hybrid buyers differed demographically; the latter were "were just 51 percent male, 78 percent of them were married, 89 percent had no kids in the household, and their average age was 61", while the former "included far more men than women[,] [f]ewer of them were married, but more of them had children in the house, and they were fully 17 years younger, with an average age of 44." Likewise, a Volkswagen Clean Diesel IQ survey found that diesel car customers are highly aware of the benefits of clean diesel technology in contrast to hybrid and gasoline car customers. Furthermore, 94% of diesel customers will purchase clean diesel cars again while only 26% of hybrid and gasoline car customers will consider clean diesel cars for their next purchase.[64] All of this indicates little cross-elasticity of demand between hybrid vehicles and Clean Diesel vehicles.

60. Indeed, the major European competitors of Volkswagen in the Clean Diesel Car Market belong, along with Volkswagen, to an organization that is devoted to extolling the benefits of Clean Diesel cars.[65]

61. BloombergBusiness noted that consumers are willing to pay a substantial premium

---

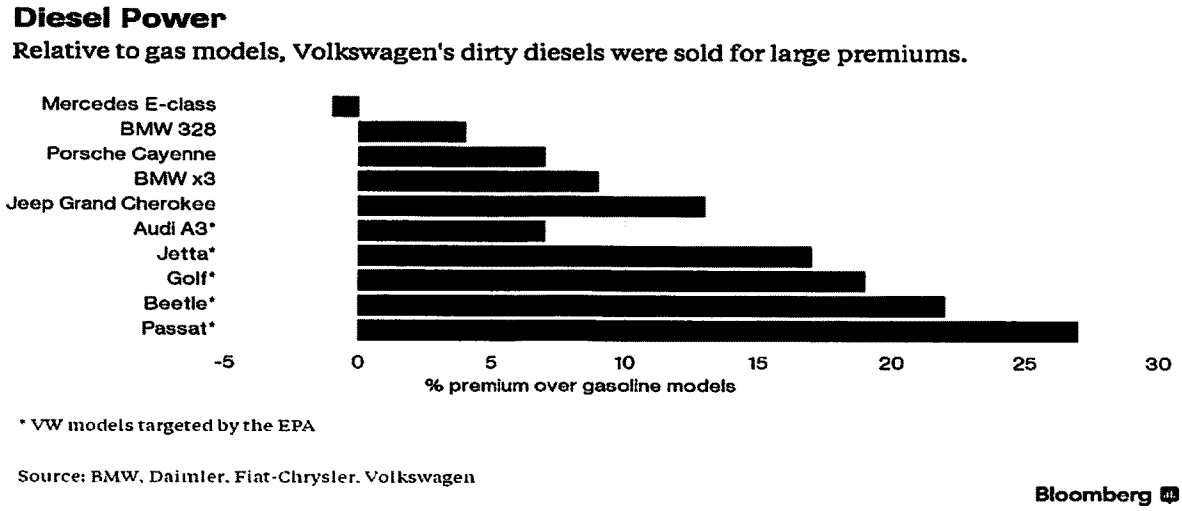
[62] http://mobile.nytimes.com/2015/09/27/business/as-vw-pushed-to-be-no-1-ambitions-fueled-a-scandal.html?referer.

[63] http://www.greencarreports.com/news/1080201_vw-diesel-buyers-hybrid-buyers-both-want-fuel-economy-but-beyond-that.

[64] http://www.autosphere.ca/fleetdigest/2013/04/01/volkswagen-surveys-diesel-drivers/. *See also* http://www.cmu.edu/gdi/docs/diesel-and.pdf (noting many key differences between diesel and hybrid car customers).

[65] http://www.clearlybetterdiesel.org/index.html#cleanDiesel.

for Clean Diesel vehicles over those of its competitors.[66]



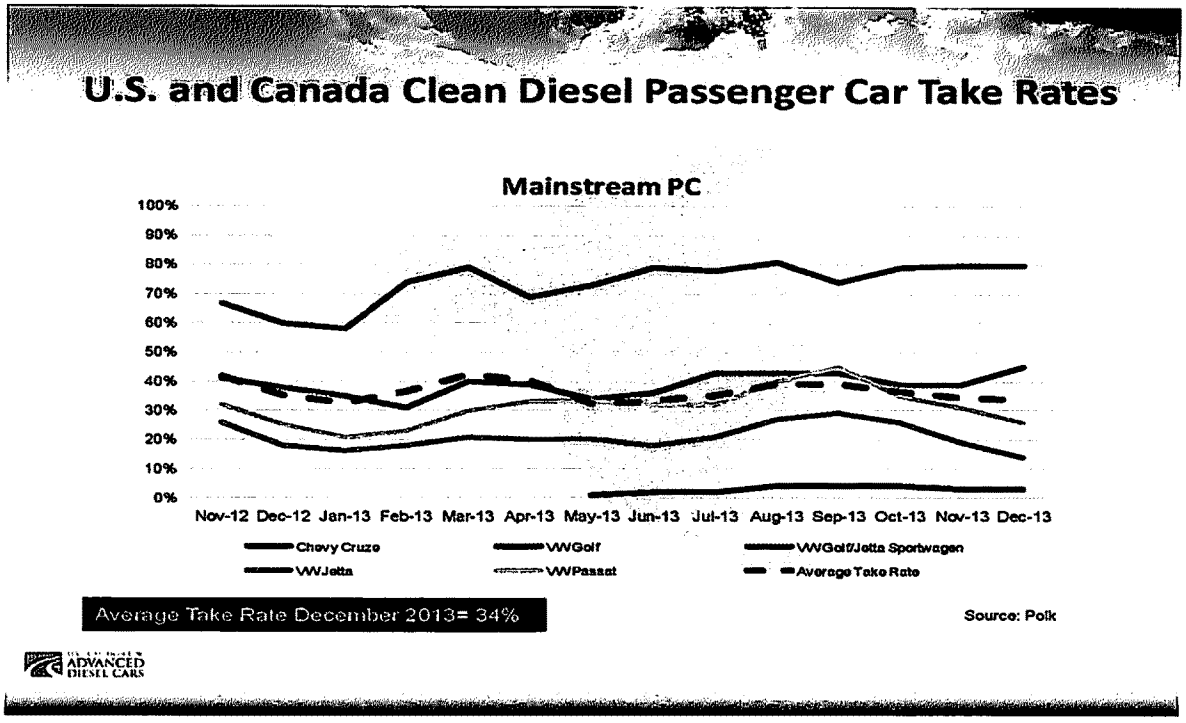
62. As the BloombergBusiness article goes on to explain:

> The math on diesel has never been tidy. The additional mileage is great, but unless one drives a lot, it doesn't really cover the added expense for the engine and for the fuel itself. At current gas prices, the diesel premium on the Passat—some $5,755—would buy enough gas to drive the gas-burning model for about 88,000 miles. **For the majority of diesel drivers, the factor that probably swung the decision was the apparent environmental benefit. The green aspect was the fulcrum.** (Emphases added).

Thus, Volkswagen's false claims about its TDI technology were a driving factor in the premium prices it charged consumers for such technology. As noted above, VWAG has taken full responsibility for the "economic damage" caused by its illegal conduct.

[66] http://www.bloomberg.com/news/articles/2015-09-23/volkswagen-s-other-diesel-ruse-premium-pricing.

63. A chart contained in a presentation made by CMW Research at the March 2015 DTF conference[67] underscores the differences in take rates between Volkswagen Clean Diesel cars and those made by its competitors:



64. The price premium for Clean Diesel vehicles is also reflected in this chart showing the price differentials between gasoline-powered models and Clean Diesel models of Volkswagen's own cars:

Clean Diesel Price Premium				
Mode	**Base**	**Mid-Level**	**Top-Level**	**Average**
VW Jetta	$2,860.00	$1,570.00	$1,030.00	$1,820.00
VW SportWagen	$5,570.00	$1,680.00	$0.00	$2,416.67
VW Golf	$2,400.00	$1,000.00	$1,000.00	$1,466.67
VW Golf	$2,950.00	$1,000.00	$1,000.00	$1,650.00
VW Beetle	$4,635.00	$4,920.00	$0.00	$3,185.00
VW Beetle	$4,080.00	$530.00	$700.00	$1,770.00
VW Passat	$5,755.00	$2,845.00	$2,135.00	$3,578.33

[67] http://cleandieseldelivers.com/media/Take-Rate-Slides-March-2014.pdf.

Audi A3	$2,300.00	$2,300.00	$2,300.00	$2,300.00
Average	$3,818.75	$1,980.63	$1,020.63	$2,273.33

E. Volkswagen's False Advertising.

65. Volkswagen, as part of its plan to increases sales and market share in the United States, increased its emphasis on diesel-powered cars and began marketing these cars heavily to the United States public beginning in 2008. It emphasized the TDI Clean Diesel cars' environment-friendly engine, excellent gas mileage, and high-quality performance. In one advertisement (which, as of this writing, was available on Audi's website after the scandal surfaced and is attached as Exhibit 5 to the Complaint),[68] for example, Volkswagen claimed:

> Getting more from less. Audi pioneered TDI® clean diesel engines to deliver more torque, lower fuel consumption and reduce CO2 emissions, compared to equivalent gasoline engines. The result of this revolutionary engineering delivers remarkable performance, while achieving increased fuel economy.

66. Another advertisement by VWAG for Clean Diesel cars asserts that

> This ain't your daddy's diesel. Stinky, smoky, and sluggish. These old diesel realities no longer apply. Enter TDI Clean diesel. Ultra-low-sulfur fuel, direct injection technology, and extreme efficiency. We've ushered in a new era of diesel.[69]

This internet advertisement is attached as Exhibit 6 to the Complaint.

67. Volkswagen's advertising relentlessly touted the supposed fuel efficiency and environmental features of its Clean Diesel TDI vehicles. In 2009, Volkswagen introduced its "Meet the Volkswagens" campaign, which promoted "fuel efficiency, green credentials, cost of ownership and safety," and compared Volkswagen's diesel passenger cars to its competitors. According to Tim Ellis, Volkswagen's marketing chief, the goal of this advertising campaign was to "grow the brand in the U.S."[70] This campaign, among other things, included social media links

---

68 https://web.archive.org/web/20150928180733/http://www.audiusa.com/technology/efficiency/tdi

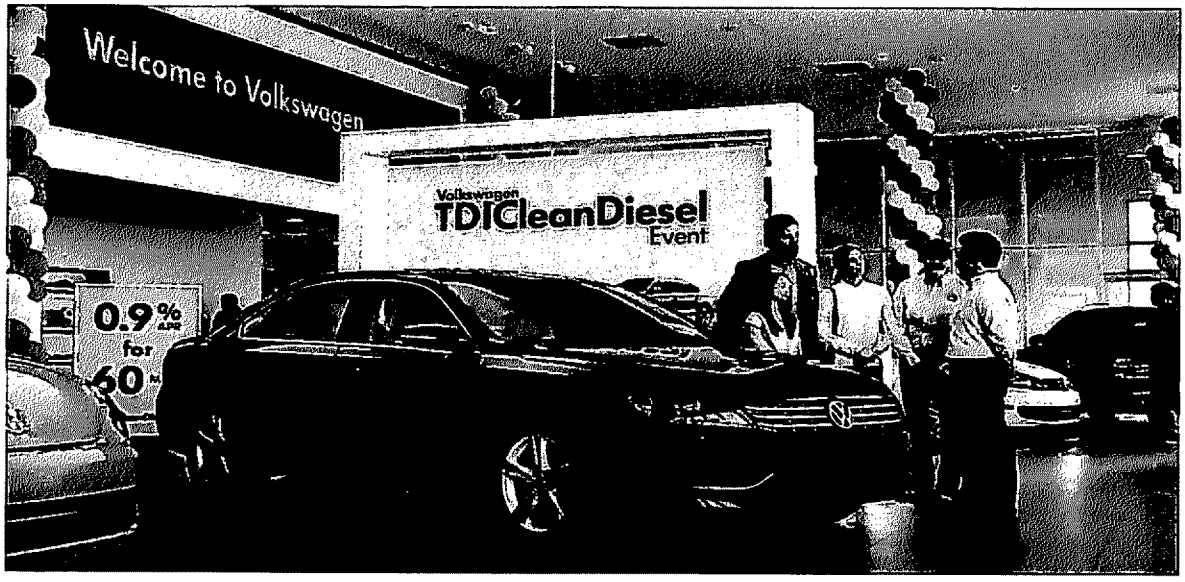
69 https://web.archive.org/web/20150330110301/http://www.vw.com/features/clean-diesel/.

70 http://abcnews.go.com/Business/story?id=7493781.

to a blog (tdi.vw.com/tdi), which focused on Volkswagen's TDI clean diesel model.

68. Between 2011 and 2013, Volkswagen spent more than $2.9 billion annually on advertising world-wide; many of those advertising dollars were directed at the United States public. Volkswagen issued hugely popular videos featuring the Golden Sisters, who purported to debunk the myths about polluting diesel cars.[71] Other videos that were highly successful included a "Truth or Dare" effort started in 2009 that was about "debunking the myths on clean diesel and fueling the passion of existing diesel owners"; a 2009 Audi video that proclaimed "diesel, no longer a dirty word"; and a Passat "being a Mom" video, all of which can be viewed on the *New York* magazine website.[72] Another well-known video showed German engineers of TDI Clean Diesel vehicles earning their "angel's wings."[73]

69. Volkswagen also used point-of-purchase displays at the showrooms of Volkswagen Authorized Dealers such as the one depicted below:



[71] http://blog.caranddriver.com/vws-hilarious-new-tdi-diesel-ads-return-excellent-viral-mileage/.

[72] http://nymag.com/daily/intelligencer/2015/09/vws-clean-diesel-ads-now-make-us-feel-dirty.html.

[73] https://www.youtube.com/watch?v=fwkPEza9FPw.

70. As VWoA's Mark Barnes put it, the TDI Clean Diesel cars were "fantastic power train[s]" with "very good fuel economy." Yet "[i]t's also good for the environment because it puts out 25% less greenhouse gas emission than what a gasoline engine would. And thanks to the uniqueness of the TDI motor, it cuts out the particulate emissions by 90% and the emissions of nitrous oxide are cut by 95%. So a very very clean running engine. Clean enough to be certified in all 50 states."[74]

71. In television and print advertisements and in social media, Volkswagen strived to present its Clean Diesel TDIs as the environmentally-friendly, fuel-efficient, fun-to-drive and reasonably priced passenger car. As noted above, Volkswagen's sham advertising campaign was a success. Unfortunately, all of these accolades were based on a sham perpetrated by Volkswagen for seven years.

F. Volkswagen's Defeat Device.

72. As noted above, Volkswagen's defeat device is described as a "sophisticated software algorithm" that detects when the car is undergoing emissions testing. The algorithm used information about how the car was being steered, how long the engine ran and atmospheric pressure to "precisely track" the conditions that corresponded to a federal emissions test, according to the EPA. During emissions testing, the software "turns on" the car's full emissions control system in order to pass the test. Under normal driving situations, however, these emissions control systems are ***turned off***, allowing the cars to spew as much as 40 times the allowable amount of NOx into the air. As an EPA spokesman noted, the defeat device was "particularly difficult for us to detect."[75] This ruse went undetected for seven years, although as noted above, Bosch and one

[74] http://www.businessinsider.com/volkswagen-preps-for-a-diesel-revolution-2009-10.

[75] http://www.washingtonpost.com/news/wonkblog/wp/2015/09/22/anatomy-of-volkswagons-deception-the-recall-that-never-fixed-any-cars/. A useful timeline of how the scandal came to light is provided on the website of Cars.com: https://www.cars.com/articles/vw-diesel-crisis-timeline-of-events-1420681251993/.

of VWAG's own engineers complained about it to the company.

73. One technology blog has described Volkswagen's defeat device as follows:

> The method by which Volkswagen diesel cars were able to thwart emissions tests and spew up to 40X the nitrogen oxide levels set by the Environmental Protection Agency was relatively simple. It was more likely no more than a single line of code used to detect when an emissions test was being performed and place the emissions system in an alternate mode — something as simple as a software "on/off" switch. Volkswagen AG CEO Martin Winterkorn, who stepping down as the result of his company's scandal, has said he had no knowledge of the emissions cheat, but software dev/test audit trails are almost certain to pinpoint who embedded the code and who authorized it. You can actually see who asked the developer to write that code," said Nikhil Kaul, a product manager at test/dev software maker SmartBear Software. "Then if you go upstream you can see who that person's boss was...and see if testing happened...and, if testing didn't happen. So you can go from the bottom up to nail everyone."[76]

74. As also noted above, 482,000 vehicles were described as affected, with over 50,000 in the state of California.[77]

75. In 2013 and again in 2014, the International Council for Clean Transportation ("ICCT") published studies showing serious discrepancies between laboratory and in-use emissions of certain cars, including VW TDI Diesel cars used in Europe.[78] A decision was made to test American Clean Diesel cars to show that they were success stories; the opposite turned out to be the case. The ICCT, in conjunction with researchers at and West Virginia University's Center for Alternative Fuels, Engines and Emissions ("CAFEE") conducted on-road emissions tests on three vehicles sold in the United States: a 2013 TDI Passat, a 2012 TDI Jetta, and a BMW X5

---

[76] http://developers.slashdot.org/story/15/09/24/1423225/how-did-volkswagen-cheat-emissions-tests-and-who-authorized-it.

[77] http://www.latimes.com/business/autos/la-fi-hy-california-dmv-vw-diesel-20150921-story.html. This number excludes unregistered vehicles.

[78] http://theicct.org/sites/default/files/publications/ICCT_LabToRoad_20130527.pdf; http://www.theicct.org/sites/default/files/publications/ICCT_LaboratoryToRoad_2014_Report_English.pdf)

SUV. These researchers found that for the Passat and Jetta, emissions were far higher than the emissions generated in the laboratory by CARB. The Jetta exceeded United States NOx emissions standard by 15 to 35 times, and the Passat by five to 20 times. In laboratory testing by CARB, in contrast, these same vehicles complied with United States NOx emissions standards. The CAFEE report is attached as Exhibit 7 to the Complaint. ICCT brought the information to the attention of CARB and the EPA, who commenced their own investigations and contacted Volkswagen. Volkswagen chalked the discrepancies up to "various technical issues and unexpected in-use conditions", but agreed in December of 2014 to recall approximately 500,000 vehicles in order to apply a "software patch."[79]

76. After the remediation, CARB in May of 2015 tested a 2012 TDI Passat on the road and in the laboratory. It found some improvement in in-use NOx emissions, but not enough. An article in the *Philly Voice* describes what happened next.

> On July 8, CARB shared its results with VW, but there was no change in Volkswagen's position. Some officials privately questioned whether Volkswagen was deliberately violating the federal Clean Air Act by installing defeat devices -- software programmed to switch engines to a cleaner mode during official emissions testing, according to a person involved in the process.
>
> During normal driving, the software then shuts off, enabling cars to emit as much as 40 times the legal limit of pollutants.
>
> In early August, Oliver Schmidt, who followed [Norbert] Krause and preceded [Stuart] Johnson in VW's U.S. engineering and environmental office, attended a conference in Traverse City, Michigan and told regulators Volkswagen stood by its conclusions that the problem was technical, people involved said.[80]

77. Then, on August 21, there was a complete reversal. The *Philly Voice* article goes on to describe what happened:

> After more than a year of stonewalling investigators, Volkswagen stunned two senior officials with the U.S. Environmental Protective Agency and California's environmental watchdog by admitting the automaker hacked its own cars to deceive U.S.

[79] http://www.cnbc.com/2015/09/24/.

[80] http://www.phillyvoice.com/year-stonewalling-volkswagen-stunned-regulators/.

> regulators about how much their diesel engines pollute.
>
> That disclosure on Aug. 21, confirmed by two people with knowledge of the exchange, shows Volkswagen buckled to pressure from environmental regulators almost a month earlier than the scandal was made public. The admission to regulators came after a year during which VW officials insisted to regulators that tests on its diesel cars showing a spike in pollution levels on the road were in error.
>
> ****
>
> At first, regulators were surprised that Volkswagen would make its confession at the conference, held in Pacific Grove, California. Minutes before Christopher Grundler, director of the EPA's transportation and air quality office, was to deliver a 9 a.m. speech to the conference, a Volkswagen representative told him about the deception. At the same meeting, representatives of the California Air Resources Board, a state agency that had been pushing VW hard, were also given a verbal notice of the deception, people with knowledge of the events said.
>
> Volkswagen declined to comment on the sequence of events described to Reuters. It isn't clear which VW representative delivered the news of the deception to Grundler and the CARB. Stuart Johnson, head of VW's engineering and environmental office in the United States, was registered to attend the Aug. 21 conference, which was organized by the University of California, Davis. Johnson, who still works for VW in Auburn Hills, Michigan, did not respond immediately to a request for comment.

78. Volkswagen was faced with the threat that the EPA it would not certify any of its 2016 models for sale in the United States until the questions surrounding the emissions discrepancies were answered. Volkswagen admitted that it relied upon a "second calibration" in the vehicles that was intended to run only during certification testing. This second calibration was triggered when a highly sophisticated software algorithm determined – after measuring factors like the position of the steering wheel, the vehicle's speed, pedal movement, and even barometric pressure – that the car was being tested. Then it would configure the engine to reduce emissions of NOx. As David Clegern of CARB explained, "[w]e met with VW on several occasions and they continued to dispute our data, so we'd return to the lab. Over time, VW had no other explanations left, and it was our lab staff who actually got VW to admit that there was, in fact, a defeat device."[81]

[81] http://www.foxnews.com/leisure/2015/09/22/for-7-years-vw-software-thwarted-pollution-regulations/.

As another CARB spokesperson told the *Washington Post*, "[t]hey basically ran out of excuses."[82]

79. The scandal surfaced on September 18, 2015, when CARB and the EPA announced that VWAG, Audi and VWoA had illegally installed emissions testing "defeat devices" in the aforementioned vehicles. *See* Appendices 1 and 2. The EPA found violations of 42 U.S.C. §§7522(a), 7522(a)(1) and 7522(a)(3)(B), as well as 40 C.F.R. §§86.1854-12(a)(3)(ii) and 86.1854-12(a). The EPA identified the following affected vehicles:

Model Year	EPA Test Group	Make and Model(s)
2009	9VWXV02.035N	VW Jetta, VW Jetta Sportwagen
2009	9VWXV02.0U5N	VW Jetta, VW Jetta Sportwagen
2010	AVWXV02.0U5N	VW Golf, VW Jetta, VW Jetta Sportwagen, Audi A3
2011	BVWXV02.0U5N	VW Golf, VW Jetta, VW Jetta Sportwagen, Audi A3
2012	CVWXV02.0U5N	VW Beetle, VW Beetle Convertible, VW Golf, VW Jetta, VW Jetta Sportwagen, Audi A3
2012	CVWXV02.0U4S	VW Passat

80. As noted above, Horn of VWoA admitted that Volkswagen was dishonest with both customers and regulators and Huber of VWAG called the matter a "moral and political disaster."

[82] http://www.washingtonpost.com/news/wonkblog/wp/2015/09/22/anatomy-of-volkswagonsdeception-the-recall-that-never-fixed-any-cars/.

81. Volkswagen has ordered its dealers to cease selling the Class Vehicles[83] and has set aside a minimum of 6.5 billion Euros ($7.2 billion) to deal with the fallout from this catastrophe, which it now concedes involved 11 million vehicles worldwide. An internal memorandum issued on September 22 details this:

Wolfsburg, 22 September 2015

Volkswagen AG has issued the following information:

Volkswagen is working at full speed to clarify irregularities concerning a particular software used in diesel engines. New vehicles from the Volkswagen Group with EU 6 diesel engines currently available in the European Union comply with legal requirements and environmental standards. The software in question does not affect handling, consumption or emissions. This gives clarity to customers and dealers.

Further internal investigations conducted to date have established that the relevant engine management software is also installed in other Volkswagen Group vehicles with diesel engines. For the majority of these engines the software does not have any effect.

Discrepancies relate to vehicles with Type EA 189 engines, involving some eleven million vehicles worldwide. A noticeable deviation between bench test results and actual road use was established solely for this type of engine. Volkswagen is working intensely to eliminate these deviations through technical measures. The company is therefore in contact with the relevant authorities and the German Federal Motor Transport Authority (KBA – Kraftfahrtbundesamt).

To cover the necessary service measures and other efforts to win back the trust of our customers, Volkswagen plans to set aside a provision of some 6.5 billion EUR recognized in the profit and loss statement in the third quarter of the current fiscal year. **Due to the ongoing investigations the amounts estimated may be subject to revaluation.**
Earnings targets for the Group for 2015 will be adjusted accordingly.

Volkswagen does not tolerate any kind of violation of laws whatsoever. It is and remains the top priority of the Board of Management to win back lost trust and to avert damage to our customers. The Group will inform the public on the further progress of the investigations constantly and transparently.

82. Volkswagen has indicated it will initiate a recall and remediation of the Class Vehicles, but there is no "fix" that can be achieved that would not result in lesser mileage per gallon or degraded performance, two of the key attributes on which TDI Clean Diesel cars were sold.

[83] *See* http://pics3.tdiclub.com/data/3209/stop-sale-note3.pdf.

> Experts Reuters spoke to indicate that two potential fixes could be needed for the two types of emissions control systems featured on 482,000 cars in the U.S., complicating the recall and refit process. Some experts opined that just a software solution could make the affected vehicles compliant with EPA regulations, reducing the performance characteristics of the engines in the process, while others suspect that a hardware solution may be needed for older vehicles without the urea injection system.
>
> A couple of experts warned that the potential solution could involve significantly increased consumption of urea, necessitating fill-ups at more frequent intervals such as every 5,000 miles, in addition to reducing the performance of the engines.[84]

The same point was made by the West Virginia AG in a complaint filed on October 2 against Volkswagen for civil penalties. It is attached as Exhibit 8. In that complaint, the West Virginia AG notes that "Volkswagen will not be able to comply with the EPA [recall] order to make the Affected Vehicles comply with emissions standards without substantially degrading their performance and fuel efficiency to a level below that advertised by Volkswagen, and below that experienced by consumers prior to, or when they purchased their vehicles." Thus, there is no valid "cure" for Volkswagen's conduct.

83. Nor can any recall cure the tarnished reputation of Volkswagen's TDI Clean Diesel vehicles and the substantial diminution of their resale value. The Kelley Bluebook has reported that prices for used Volkswagen diesel cars have declined by 21% in the last few weeks, reflecting the aftermath of Dieselgate.[85] Thus, customers not only overpaid when they bought the Class Vehicles, but have suffered a significant diminution of the resale value of their vehicles. Indeed, a survey of 460 fleet buyers in the United Kingdom revealed that 49% of them were reconsidering their contracts with Volkswagen in the aftermath of the Dieselgate revelations.[86]

84. As noted above, the Executive Committee of the Board that accepted his retirement

---

[84] http://autoweek.com/article/car-news/vw-diesel-emissions-fix-may-require-2-solutions.

[85] http://www.latimes.com/business/autos/la-fi-hy-auto-sales-20151001-story.html.

[86] http://www.dailymail.co.uk/money/news/article-3258793/VW-scandal-deepens-revealed-half-company-car-buyers-ditch-embattled-firm.html.

said that it "recognizes the economic damage caused" as well as the "loss of trust" among customers. No recall and supposed remediation can correct that.

85. A survey of vehicle owners conducted by AutoPacific[87] further reveals consumer disgust with Volkswagen. Only one in four have a positive opinion of Volkswagen, compared to three in four before the scandal. The corresponding figures for Audi were 29%, as opposed to 69%. Sixty-four percent of the survey respondents say they do not trust Volkswagen.

86. But the illegal conduct by Volkswagen has not just resulted in economic damage and loss of consumer trust. It has caused **the death of dozens of people in the United States over the last seven years and degraded the health of many more**. On October 3, Associated Press ("AP") laid out the facts.[88] AP calculated exhaust pollution year by year, starting with the ten to 40 times emissions level estimate by the EPA and then factored in mileage and car number totals from the Kelley Blue Book. It came up with a range of NOx pollution caused by the Class Vehicles and then took it to scientists who modeled mortality rates, which were confirmed by a dozen experts in emissions, risk and public health, none of whom were environmental advocates or representatives of automobile manufacturers. The results are depicted in the chart that follows.

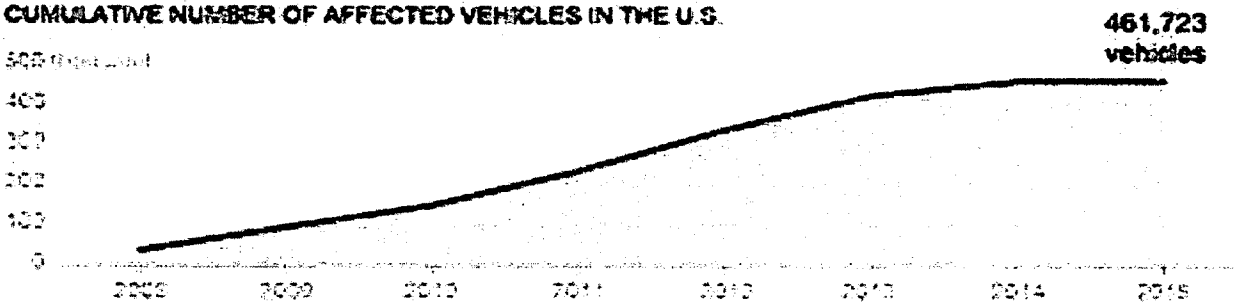
[87] http://www.autopacific.com/news-app/story.248/title.volkswagen-s-reputation-takes-big-hit-with-vehicle-owners-autopacific-predicts-tough-road-ahead.

[88] http://bigstory.ap.org/article/a6925f0af82e44aaa1a1ed4b55d030f6/ap-analysis-dozens-deaths-likely-vw-pollution-dodge.

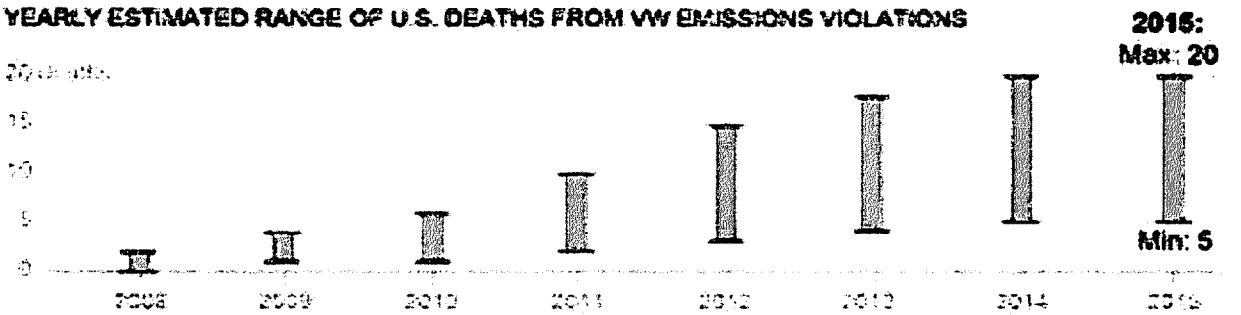
Calculating human toll of VW emissions problems

U.S. pollution resulting from Volkswagen's dodging of emissions tests is enough to have caused dozens of deaths since 2008. An AP analysis calculated upper and lower limits of pollution using the number of affected vehicles each year and average mileage. Scientists used that data in epidemiological computer models to estimate a range of deaths.

CUMULATIVE NUMBER OF AFFECTED VEHICLES IN THE U.S.

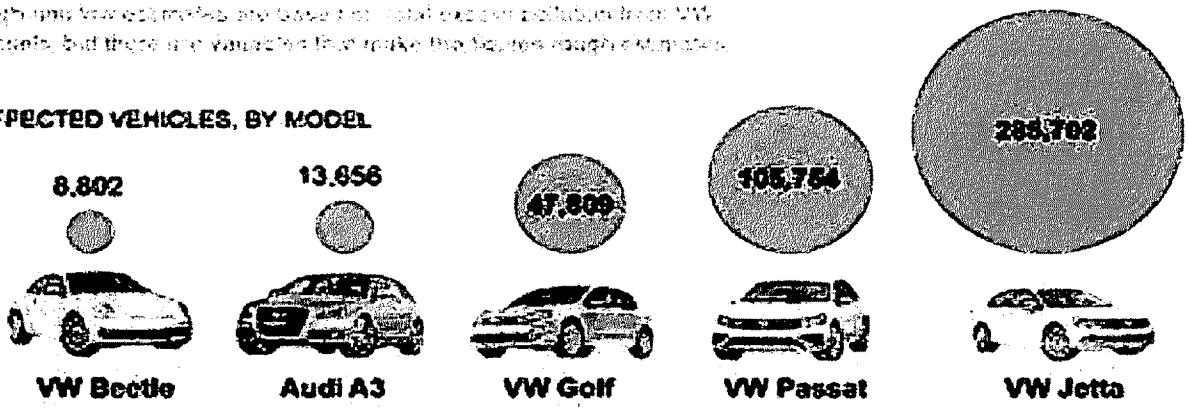


YEARLY ESTIMATED RANGE OF U.S. DEATHS FROM VW EMISSIONS VIOLATIONS



High and low estimates are based on total excess pollution from VW diesels, but there are variables that make the figures rough estimates.

AFFECTED VEHICLES, BY MODEL



NOTE: The total of 47,809 for VW Golf includes 8,833 VW GTI Sportwagen vehicles. The total of 461,723 is derived from Kelley Blue Book vehicle registration data. The Environmental Protection Agency puts the total number of affected vehicles in the U.S. at about 482,000.

SOURCES: AP analysis of data from the U.S. Environmental Protection Agency and Kelley Blue Book; AP Statistical Police Affairs Cutting by Mike Volkswagen Asst.

87. As the AP article notes, the Class Vehicles spewed enough NOx over the course of seven years to significantly degrade the environment in urban areas. Eric Schneiderman, the New York AG has said that "[t]he stakes could not be higher for the health and safety of our communities who, if Volkswagen's own admissions are true, have for years been breathing air containing excess pollution from their vehicles."[89] Harris County Texas (where the City of Houston is located) has already sued Volkswagen for $100 million in harm to air quality.[90]

88. As noted in the *Minneapolis Star-Tribune* in a follow-up piece on the AP story:

> Computer software allowed VW diesel cars to spew between 10 to 40 times more nitrogen oxides (NOx) than allowed by regulation, making this "clearly a concern for air quality and public health," said Janet McCabe, acting air quality chief for the U.S. Environmental Protection Agency.
>
> Nitrogen oxides mostly form smog — that murky, dirty air that makes it hard to see and for some people to breathe — but also amplify a deadlier, larger problem: tiny particles of soot. Numerous medical studies show those tiny particles cause about 50,000 deaths a year in the United States, mostly from heart problems.
>
> Nitrogen oxides can travel hundreds of miles, so pollution spewed in Pittsburgh can be felt on the East Coast, [Carnegie Mellon environmental engineer Professor Peter] Adams said.
>
> Experts calculate how much pollution costs society by looking at the value of lost lives. In this case, Adams and other said the lost lives — valued at $8.6 million apiece — overwhelm other costs such as lost work days or hospital costs. The overall annual cost of the extra pollutants from the VW diesels ranged from $40 million to $170 million, environmental engineering professors calculated. "Even the small increase in NOx from VW diesel emissions is likely to have worsened pollution along the roadways where they have traveled, and affected the lives of hundreds of thousands of people," said Dan Greenbaum, president of the Health Effects Institute in Boston.

---

[89] http://mobile.nytimes.com/2015/10/03/business/us-states-jumping-into-investigation-of-vw-emissions-deception.html?_r=0&referer=https://www.google.com/.

[90] http://www.wsj.com/articles/u-s-justice-department-conducts-criminal-probe-of-volkswagen-sources-say-1442869059.

> "To say millions of people of people are breathing poor air as the result of that is not off the mark," said Greenbaum, who runs the institute that is funded by both the EPA and the auto industry to serve as an independent arbiter of the science.[91]

89. The revelation of the scandal has led to numerous consequences in the United States. The DOJ is conducting a criminal probe of Volkswagen.[92] AGs in 30 states have initiated their own investigation.[93] A Texas judge has issued a temporary restraining order preventing the Class Vehicles from being sold within the state. *See* Exhibit 9 to the Complaint. The Subcommittee of Oversight & Investigations of the Energy & Commerce Committee of the United States House of Representatives has initiated an investigation and sent letters to Volkswagen and the EPA.[94] Horn has said he will testify before the committee on October 8.[95] Fred Upton, the chairman of the full committee, has stated that "[t]he very notion of a carmaker intentionally violating our environmental laws is beyond belief....[R]eports of Volkswagen selling cars with devices aimed at skirting the law cannot, and will not be tolerated. Attempting to deceive regulators and customers is a double whammy of betrayal."[96] Nearly 200 private lawsuits have been filed, many of them class actions. Among those class actions, most involve class claims for individual statewide classes, as opposed to federal claims for nationwide classes.

90. Outside the United States, several countries are investigating Volkswagen's

[96] http://energycommerce.house.gov/press-release/suboversight-schedules-volkswagen-hearing-october-8.

conduct.[97] Switzerland has banned the sale within its borders of certain Volkswagen TDI Diesel cars sold in Europe.[98] Prosecutors in Paris have launched an investigation for suspected "aggravated" deception of affected vehicles sold in France; French Environment Minister Segolene Royal called Volkswagen's conduct "a form of theft from the taxpayer and the state."[99] The Italian antitrust authority has also commenced an investigation, saying "Volkswagen's claims about emissions and certifications in advertising campaigns and information brochures distributed by dealers might have induced consumers to make an error in their choice."[100]

91. As noted above, Volkswagen has set aside $7.2 billion to deal with the costs of the scandal. That will not be nearly enough. James E. Tierney, a former AG in Maine, has been quoted as saying that the costs to Volkswagen might be "'incalculable,' with each false advertisement to consumers, for example, carrying a potential penalty. 'This product was designed to operate illegally, and that is very serious.'"[101]

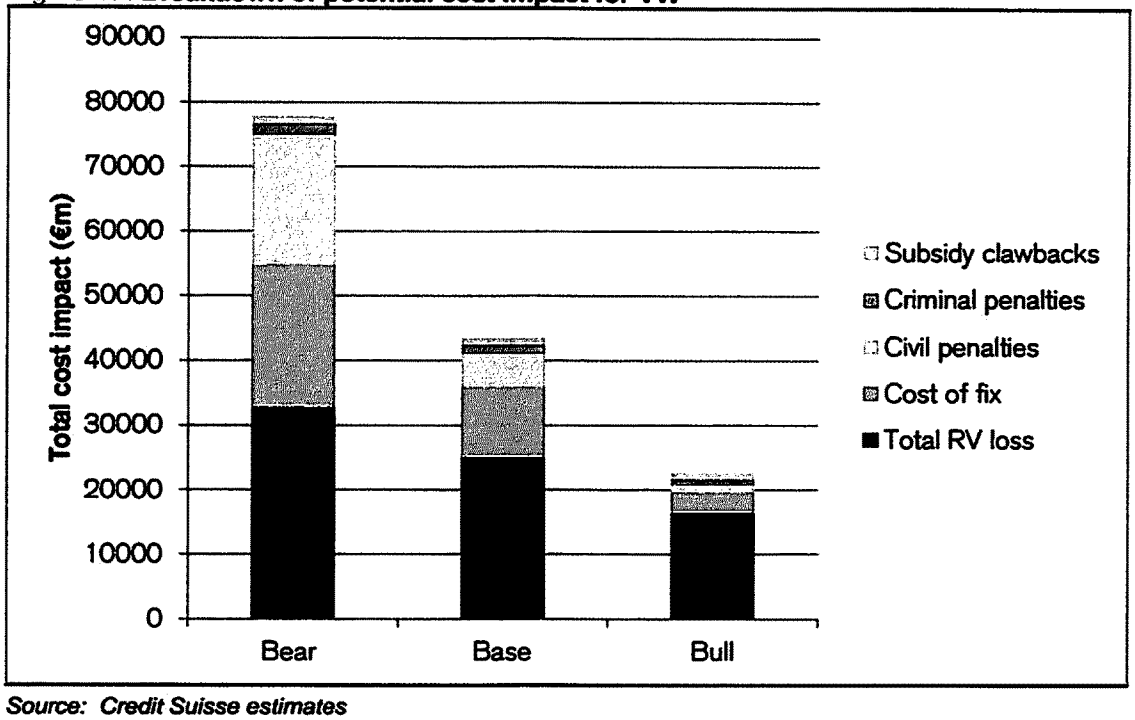
[101] http://mobile.nytimes.com/2015/10/03/business/us-states-jumping-into-investigation-of-vw-emissions-deception.html?_r=0&referer=https://www.google.com/.

92. Nonetheless, some attempts at calculation have been made. On October 2, Credit Suisse disseminated an analysis showing Volkswagen's anticipated costs in a "bull" scenario (where events turned out favorably to it), a "base" scenario, and a "bear" scenario (where events turned out unfavorably).[102] The "bull" scenario was $25.6 billion in costs, while the "bear" scenario was $87.1 billion. The analysis is summarized in the following chart:

Figure 17: **Breakdown of potential cost impact for VW**



Source: Credit Suisse estimates

As can be seen, costs associated with criminal and civil penalties make up a significant portion of the differing amounts. Credit Suisse also predicts that Volkswagen's stock may decline another 20%.

VI. CLASS ACTION ALLEGATIONS.

93. Plaintiffs bring this action both on behalf of themselves, and as a class action pursuant to Federal Rules of Civil Procedure 23(a) and (b)(3), on behalf of the following class (the

[102] http://www.businessinsider.com/credit-suisse-volkswagen-shares-could-fall-another-20-2015-10?r=UK&IR=T.

VW FOIA, EPA 06/20/2017 2017-FFP_034246

"Class").

> All persons and entities who purchased or leased a Class Vehicle from a Volkswagen Authorized Dealer in the United States. Excluded from the Class are Defendants, their parent companies, subsidiaries and affiliates, any co-conspirators, all governmental entities, and any judges or justices assigned to hear any aspect of this action.

The Class includes subclasses of persons located in California and Virginia. These will be referred to herein as the "California Subclass" and the "Virginia Subclass."

94. Plaintiffs do not know the exact number of Class and Subclass members but believe based on published reports that there are more than 482,000 Class members, geographically dispersed throughout the United States such that joinder of all class members is impracticable. The identity of Class members can be determined from the internal records of Volkswagen.

95. Plaintiffs' claims are typical of the claims of the Class and Subclasses in that Plaintiffs purchased or leased a Class Vehicle from a Volkswagen Authorized Dealer in the United States. All Class and Subclass members were damaged by the same wrongful conduct of Defendants and their co-conspirators as alleged herein, and the relief sought is common to the class.

96. Common questions of law and fact predominate over any individual questions. These questions include, but are not limited to:

- Whether Volkswagen unlawfully acquired a monopoly in the Clean Diesel Car Market;
- Whether the Clean Diesel Car Market is a properly defined product market for purposes of Section 2 of the Sherman Act;
- Whether Volkswagen's acquisition and/or maintenance of a monopoly in the Clean Diesel Car Market had the effect of increasing to supracompetitive levels the retail prices of Class Vehicles;
- Whether Volkswagen violated the CAA and applicable regulations;
- Whether Volkswagen violated California Pollution Control laws and applicable

regulations;

- Whether Volkswagen's conduct violated RICO;
- Whether the Volkswagen RICO Enterprise as defined herein is a cognizable RICO enterprise;
- Whether Volkswagen committed federal mail and wire fraud, thus establishing predicate acts under RICO:
- Whether Volkswagen engaged in a pattern of racketeering activity;
- Whether Plaintiffs and Class members were injured in their business or property, and, if so, what is the appropriate measure of their damages;
- Whether Volkswagen misrepresented the environmental impact of its Class Vehicles;
- Whether Volkswagen misrepresented the Class Vehicles' emission standards compliance, fuel efficiency or performance;
- Whether Volkswagen violated the Magnuson-Moss Warranty Act;
- Whether Volkswagen violated California's Consumer Legal Remedies Act;
- Whether Volkswagen violated California's Unfair Competition Law;
- Whether Volkswagen violated California's False Advertising Law;
- Whether Volkswagen violated Virginia's Consumer Protection Law;
- Whether Volkswagen committed fraudulent concealment;
- Whether Volkswagen was unjustly enriched;
- Whether Plaintiffs and the other members of the Class and Subclasses were injured by Defendants' conduct, and, if so, the appropriate classwide measure of damages for Class members; and
- The scope of any injunctive and other equitable relief to which Plaintiffs and the other members of the Class and Subclasses are entitled.

97. These and other questions of law and fact are common to the Class and Subclasses

VW FOIA, EPA 06/20/2017 2017-FFP_034248

predominate over any questions affecting only individual Class members.

98. Plaintiffs' claims are typical of the claims of the Class and Subclasses because Plaintiffs purchased a Class Vehicle from a Volkswagen Authorized Dealer in the United States.

99. Plaintiffs will fairly and adequately represent the interests of the Class and Subclasses in that they have no conflict with any other members of the Class and Subclasses. Furthermore, Plaintiffs have retained competent counsel experienced in antitrust, class action, and other complex litigation.

100. Defendants have acted on grounds generally applicable to the Class, thereby making final injunctive relief appropriate with respect to the Class and Subclasses as a whole.

101. This class action is superior to the alternatives, if any, for the fair and efficient adjudication of this controversy. Prosecution as a class action will eliminate the possibility of repetitive litigation. There will be no material difficulty in the management of this action as a class action. The prosecution of separate actions by individual Class and Subclass members would create the risk of inconsistent or varying adjudications, establishing incompatible standards of conduct for Defendants.

CAUSES OF ACTION

FIRST CLAIM

Violation of the Section 2 of the Sherman Antitrust Act (Monopolization) (15 U.S.C. § 2).

102. Plaintiffs incorporate by reference each preceding and succeeding paragraph.

103. The relevant product market for purposes of Plaintiffs' claims under Section 2 of the Sherman Act is the Clean Diesel Car Market, which, as noted above, consists of: (a) the product market of Clean Diesel passenger cars and (b) a geographic market consisting of the United States. All diesel fuel sold in the United States during the relevant period is "clean diesel fuel", with 97% less sulfur than the diesel sold in the 1970s. Similarly, all diesel cars sold in the United States since 2007 (which have had to meet the same emission standards as gasoline engines) have advanced engines and emissions control technology that make the diesel engines cleaner than in

VW FOIA, EPA 06/20/2017 2017-FFP_034249

the past, are able to take advantage of the clean diesel fuel, and use exhaust systems that further reduce diesel engine emissions.

104. As Volkswagen's own market research and market research by others described above have demonstrated, clean diesel cars are not in the same relevant market as gasoline or even hybrid cars of similar size and class. Diesel engines require the use of a different and more expensive fuel than gasoline-powered engines, can travel much greater distances on a single tank of fuel, and are more expensive. Unlike hybrid or electric vehicles, diesel-powered vehicles do not have to be plugged in, can travel greater distances without refueling or plugging in, and -- particularly with more recent compression technology like the Volkswagen's TDI engines -- have greater torque, acceleration, and towing power. In addition, the demographics of the clean diesel buyers are distinct from those of hybrid buyers; they are more likely to be male, younger, and less likely to have children.

105. At all relevant times, Volkswagen has been a competitor in the Clean Diesel Car Market, and has maintained significant market share. As the chart presented by Skorupski of VWoA depicted above demonstrates, Volkswagen's share of the Clean Diesel Car Market has been 70% or more during the entire relevant period.

106. Barriers to entry in the Clean Diesel Car Market are high. In addition to the barriers to entry and expansion posed by Volkswagen's anticompetitive conduct, as described in this Complaint, other barriers to entry include: high research and development costs, high costs of making diesel engines that are EPA- and CARB-compliant, and high capital costs.

107. Consumers, experts and commentators in the automotive industry, and the automobile manufacturers themselves, including Volkswagen, all recognize the Clean Diesel Car market as distinct from markets including gasoline, hybrid, or electric cars.

108. Volkswagen has monopoly power in the Clean Diesel Car Market.

109. Through the anticompetitive use of the defeat device and its deception of the EPA, CARB, Plaintiffs, and the Class, Volkswagen has willfully acquired and/or maintained its

VW FOIA, EPA 06/20/2017 2017-FFP_034250

monopoly of the Clean Diesel Car Market. This conduct has harmed competition in that market, and has caused injury to every person that purchased or leased a Class Vehicle. The purchase or lease price was higher than it would have been in a competitive market; the supply and selection of products was lower than it would have been in a competitive market; innovation has been stifled; and the number and effectiveness of competitors in that Market has been diminished by unlawful means.

110. As a result of this violation of law, the price of Class Vehicles was higher than it otherwise would have been.

111. There is no legitimate business justification for the conduct described in this Complaint which has facilitated Volkswagen's monopolization of the Clean Diesel Car Market.

112. The anticompetitive conduct described in this Complaint has caused injury to the business or property of Plaintiffs and members of the Class and is in violation of section two the Sherman Act (15 U.S.C. § 2).

113. Plaintiffs are buyers of Class Vehicles in the Clean Diesel Car Market; they are thus direct participants in the monopolized market. Volkswagen issues warranties directly to Class Vehicle buyers. The Volkswagen Authorized Dealers[103] obtain Class Vehicles from Volkswagen (through its American subsidiaries) that are certified to be EPA- and/or CARB-compliant and, as noted above, have visible stickers to that effect. The emissions testing that is used to justify those certifications is undertaken by VWoA in the United States.[104] Class Vehicles so labeled are

[103] In a recent recall notice unrelated to Dieselgate, Volkswagen has indicated that it has 652 authorized dealers in the United States. https://media.vw.com/doc/1456/volkswagen_issues_voluntary_recall-tiguan_label_recall_release-17883691505565f01ccc4bb.pdf. Their names and addresses can be identified through Volkswagen's records. The Volkswagen Authorized Dealers have a 12-person National Dealer Advisory Council that interacts closely with VWoA on such issues as company management.

[104] http://www.manufacturing.net/news/2015/10/vw-pollution-test-site-under-scrutiny-amid-emissions-cheating-scandal.

displayed on the showroom floors of Volkswagen Authorized Dealers. The false certifications by Volkswagen were one of the critical elements of its unlawful scheme of monopolization. The Volkswagen Authorized Dealers were agents of Volkswagen for the purpose of disseminating these false certifications and representations by Volkswagen to customers in order to induce them to purchase TDI Clean Diesel vehicles. In addition, Volkswagen (through its American subsidiaries) sets the Manufacturer's Suggested Retail Price ("MSRP") for Class Vehicles, which includes the premium for the TDI Clean Diesel technology described herein. While Volkswagen Authorized Dealers could charge customers a price less than the MSRP (such as when Volkswagen provides rebates or short-term retail promotions), that lesser price is nonetheless keyed off the MSRP and still contains a portion of the premium for the sham TDI Clean Diesel technology. This case involves retail prices for Class Vehicles paid by consumers like plaintiffs, who are participants in the relevant market and who pay more for those vehicles because of Volkswagen's illegal monopolistic practices.

SECOND CLAIM

Violation of Section 2 of the Sherman Antitrust Act (Attempted Monopolization) (15 U.S.C. § 2).

114. Plaintiffs incorporate by reference each preceding and succeeding paragraph.

115. Volkswagen has acted with specific intent to monopolize the Clean Diesel Car Market as described above through the anticompetitive use of the defeat device and its deception of the EPA, CARB, Plaintiffs, and the Class.

116. There was and is a dangerous probability that Volkswagen will succeed in its attempt to monopolize the Clean Diesel Car Market because Volkswagen controls a large percentage of that market and has the ability to and actually did exclude competitors through the anticompetitive conduct described in this Complaint.

117. Volkswagen's conduct has harmed competition in the Clean Diesel Car Market, making the supply and selection of available Clean Diesel Cars lower than it would be in a competitive market.

VW FOIA, EPA 06/20/2017 2017-FFP_034252

118. There is no legitimate business justification for the conduct described in this Complaint which has facilitated Volkswagen's monopolization of the Clean Diesel Car Market.

119. The anticompetitive conduct described in this Complaint has caused injury to the business or property of Plaintiffs and members of the Class and is in violation of the Sherman Act (15 U.S.C. § 2).

THIRD CLAIM

Violation of the Racketeer Influenced and Corrupt Organizations Act ("RICO") (18 U.S.C. §§ 1962(c), 1964).

120. Plaintiffs incorporate by reference each preceding and succeeding paragraph.

121. Each Plaintiff is a "person" within the meaning of 18 U.S.C. § 1964(c), and each has sustained injury to his or her business or property as a result of Volkswagen's conduct described in this Complaint.

122. Each Defendant is a "person" within the meaning of 18 U.S.C. § 1961(3).

123. Defendants violated 18 U.S.C. §1962(c) by participating in or conducting the affairs of the Volkswagen RICO Enterprise through a pattern of racketeering activity.

124. For the past seven years, Volkswagen has engaged in a deliberate, pre-meditated and continuous effort to deceive Plaintiffs, members of the Class, and federal and state regulators into believing that the Class Vehicles are environmentally-friendly, fuel-efficient, and EPA- and CARB-compliant. Unknown to Plaintiffs, Class members and federal and state regulators, Volkswagen installed pollution control defeat devices into the Class vehicles that turned off the pollution controls when the cars were in normal operating mode.

125. Plaintiffs and Class members had no way of knowing that these systems were disabled by Volkswagen. Pursuant to the CAA, Volkswagen was required to equip its cars with on-board diagnostic systems that trigger a dashboard "check engine" light that alerts the driver of a possible pollution control device malfunction. The Class Vehicles' diagnostic systems did not trigger this "check engine light," because the defeat device was designed to evade EPA and CARB pollution controls.

VW FOIA, EPA 06/20/2017 2017-FFP_034253

126. In dozens of advertising campaigns and statements and in certifications of EPA and CARB compliance Volkswagen has falsely represented the Class Vehicles' "green credentials" and performance.

127. Volkswagen engaged in a common course of conduct and conspiracy with the common purpose of defrauding Plaintiffs and members of the Class into purchasing Class Vehicles at artificially inflated prices.

The Volkswagen RICO Enterprise.

128. Volkswagen conducted the affairs of an association-in-fact enterprise (the "Volkswagen RICO Enterprise") through a pattern of racketeering activity, in violation of 18 U.S.C. § 1962(c).

129. The enterprise engaged in and continues to engage in interstate commerce, and its activities affect interstate commerce.

130. The Volkswagen RICO Enterprise is an association-in-fact enterprise comprised of the Defendants and Volkswagen Authorized Dealers in the United States. Each participant in the Enterprise played a designated, well-defined role in the affairs of the Volkswagen RICO Enterprise.

131. Volkswagen designed, manufactured, and sold to Volkswagen Authorized Dealers the Class Vehicles containing the defeat devices that are the subject of this Complaint. Volkswagen developed the advertising campaigns that misrepresented to Plaintiffs and Class members the true nature of the Class Vehicles, which were not, contrary to Defendants' misrepresentations, environmentally-friendly, fuel-efficient, or EPA- or CARB-compliant. Volkswagen deceptively certified the Class Vehicles as EPA- and CARB-compliant. And Volkswagen lied to CARB and EPA officials about the full nature and extent of the problem.

132. The Volkswagen Authorized Dealers that sold and leased the Class Vehicles to Plaintiffs and members of the Class were a critical element of the Volkswagen RICO Enterprise. Volkswagen sold the Class Vehicles to Volkswagen Authorized Dealers, who then sold or leased

VW FOIA, EPA 06/20/2017 2017-FFP_034254

them to Plaintiffs and members of the Class. Whether or not the Volkswagen Authorized Dealers knew that the Class Vehicles contained defeat devices that made Volkswagen's advertisements and representations false, the Volkswagen Authorized Dealers displayed those advertisements and repeated those misrepresentations. Indeed, Volkswagen required Volkswagen Authorized Dealers to display and repeat those misrepresentations in the Volkswagen and Audi Standard Dealer Agreements.

133. The Volkswagen RICO Enterprise has an ascertainable structure and purpose beyond the scope and commission of Volkswagens' predicate acts and conspiracy to commit such acts. The Enterprise is separate and distinct from Defendants, and functions as a continuing unit. The members of the Enterprise have distinct and separate roles and responsibilities.

134. At all relevant times, Volkswagen operated, controlled or managed the Volkswagen RICO Enterprise. Volkswagen's participation was critical for the success of the scheme to defraud because Volkswagen manufactured the Class Vehicles, designed and installed the defeat devices, and concealed those devices from Plaintiffs, Class members and regulatory authorities.

135. Section 1961(1)(B) of RICO defines "racketeering activity" as any act indictable under 18 U.S.C. §§1341 (mail fraud) and 1343 (wire fraud), among other statutes. As described in this Complaint, Volkswagen's conduct violated both of these laws.

136. Volkswagen conducted the affairs of the Volkswagen RICO Enterprise through a "pattern of racketeering activity," as defined by 18 U.S.C. §1961(5) by committing at least two acts of racketeering activity, *i.e.*, indictable violations of 18 U.S.C. §§1341 and 1343, within the past ten years. In fact, Volkswagen has committed dozens of acts of racketeering activity. Each racketeering act was related, had a similar purpose, involved the same or similar participants and method of commission, had similar results and impacted similar victims, including the Plaintiffs and members of the Class.

137. Defendants' multiple acts of racketeering activity were related to each other and amount to continued racketeering activity, and therefore constitute a "pattern of racketeering

VW FOIA, EPA 06/20/2017 2017-FFP_034255

activity" as defined in 18 U.S.C. §1961(5).

Predicate Act Violations of 18 U.S.C. §§1341 and 1343.

138. For the purpose of executing the fraudulent scheme described in this Complaint, Volkswagen, in violation of 18 U.S.C. §1341 (mail fraud), placed in post offices and/or in authorized repositories, matter and things to be sent or delivered by the U.S. Postal Service, caused matter and things to be delivered by commercial interstate carriers, and received matter and things from the U.S. Postal Service and/or commercial interstate carriers, including, but not limited to, advertising materials, marketing and sales materials, correspondence, contracts, sales and leasing documents, Certificates of Compliance, communications with the EPA, CARB and other regulatory officials, and other materials relating to the Class Vehicles sold and leased to Plaintiffs and Class members.

139. For the purpose of executing the fraudulent scheme described in this Complaint, Volkswagen, in violation of 18 U.S.C. §1343 (wire fraud), transmitted and received by wire, matter and things, which include, but are not limited to, advertising materials, marketing and sales materials, correspondence, contracts, sales and leasing documents, Certificates of Compliance, communications with the EPA, CARB, and other regulatory officials, and other materials relating to the Class Vehicles sold and leased to Plaintiffs and Class members.

140. For the purpose of executing the fraudulent scheme described in this Complaint, Volkswagen, in violation of 18 U.S.C. §§1341 and 1343, made numerous material misrepresentations about the Class Vehicles' environmental impact, fuel efficiency, and EPA- and CARB-compliance, and made many material omissions of fact, including concealing that the cars contained defeat devices that rendered them non-compliant with applicable emissions standards. Volkswagen made these misrepresentations and omissions with the intent and effect of inducing Plaintiffs to rely on such misrepresentations and omissions.

141. Defendants' misrepresentations, omissions of material facts, acts of concealment, and failures to disclose, were knowing and intentional, and made for the purpose of deceiving

VW FOIA, EPA 06/20/2017 2017-FFP_034256

Plaintiffs and Members of the Class into purchasing and leasing Class Vehicles.

142. Defendants either knew or recklessly disregarded the fact that the misrepresentations and omissions described above and incorporated herein were material, and Plaintiffs and Class members relied on the misrepresentations and omissions as set forth above.

143. Volkswagen's affirmative and deliberate misrepresentations regarding the Class Vehicles' environmental friendliness, fuel efficiency and performance, and omission of the true facts, were material factors in inducing Plaintiffs and Class members to purchase and lease the Class Vehicles. Plaintiffs and Class members relied on those misrepresentations and omissions and would have not purchased or leased the vehicles in their absence, or, at a minimum, would have paid significantly less than they did.

144. Each act of deception, as described in this Complaint, constitutes a violation of 18 U.S.C. §§1341 (mail fraud) or 1343 (wire fraud), and constitutes an act of "racketeering activity" as defined in 18 U.S.C. §1961(5).

145. As a result, Plaintiffs and Class members have been injured in their business and property within the meaning of 18 U.S.C. §1964(c). Plaintiffs' and Class members' damages include, but are not limited to: purchasing or leasing Class Vehicles that they would not otherwise have purchased or leased; paying more for Class Vehicles than they would have otherwise paid if they had known the true facts concerning the defeat devices; and purchasing Class Vehicles, the value of which has been severely diminished, thus reducing their residual and/or resale value.

146. Volkswagen's RICO violations directly and proximately caused injury to the business and property of Plaintiffs and Class members, and Plaintiffs and Class members are entitled to three times their actual damages, as well as injunctive and other equitable relief, plus their costs and reasonable attorneys' fees.

FOURTH CLAIM

Violation of the Magnuson-Moss Warranty Act (15 U.S.C.§ 2301 *et seq.*)

147. Plaintiffs incorporate by reference each preceding and succeeding paragraph.

VW FOIA, EPA 06/20/2017 2017-FFP_034257

148. Plaintiffs and the Class bring this claim under the Magnuson-Moss Warranty Act, 15 U.S.C. § 2301 *et seq.*

149. The Class Vehicles are consumer products as defined in 15 U.S.C. §2301(1).

150. Volkswagen is a supplier and warrantor as defined in 15 U.S.C. §2301(4), (5).

151. Plaintiffs and the Class received written warranties as defined in 15 U.S.C. §2301(6)(A) and/or (B), which Volkswagen has breached.

152. Plaintiffs and the Class are "consumers" as defined in 15 U.S.C. §2301(3). They are consumers because they bought a Class Vehicle and are entitled to enforce both written and implied warranties.

153. Pursuant to 15 U.S.C. § 2310(e), Plaintiffs and the Class are not required to provide Defendants notice of this class action and an opportunity to cure until the time the Court determines the representative capacity of Plaintiffs pursuant to Fed.R.Civ.P. 23.

154. Volkswagen is liable to Plaintiffs and the Class pursuant to 15 U.S.C. § 2310(d)(l) because it breached its written warranties.

155. Further, in connection with the sale of the Class Vehicles, Volkswagen gave an implied warranty under the Act. As part of that implied warranty, Volkswagen warranted that the Class Vehicle complied with all applicable federal and state regulations, including emission regulations. Volkswagen breached the implied warranty of merchantability.

156. Plaintiffs and the Class are entitled to damages caused by Volkswagen's breaches of the warranties, including economic damages based upon either a return of Plaintiffs' and Class Members purchase price; and/or the difference between the price paid for the Class Vehicle as warranted and the actual value of the Class Vehicle as delivered, and consequential damages.

157. In addition, Plaintiffs and the Class are entitled to reasonable attorneys' fees and costs as determined by the Court.

VW FOIA, EPA 06/20/2017 2017-FFP_034258

FIFTH CLAIM

Violations of the Consumers Legal Remedies Act (California Civil Code § 1750 *et seq.*)

158. Plaintiffs incorporate by reference each preceding and succeeding paragraph.

159. Plaintiffs Bourn, Watson, and Verner bring this Claim on behalf of the California Subclass.

160. This cause of action is brought pursuant to the California Consumers Legal Remedies Act ("CLRA"), Civil Code §1750, *et seq*. Plaintiffs bring this action on their own behalf and on behalf of the California Subclass, all of whom are similarly situated consumers within the meaning of Civil Code §1781.

161. The acts and practices described in this Complaint were intended to result in the sale of goods, specifically a motor vehicle, in consumer transactions. Volkswagen has violated, and continue to violate California Civil Code § 1770, subdivisions (a)(9), (a)(7), (a)(16), and (a)(5) by:

- Representing to consumers purchasing the Class Vehicles that these vehicles' emissions, fuel efficiency and high performance are as advertised and publicized.
- Representing in their advertising emissions, environmental, fuel efficiency and performance characteristics for the Class Vehicles that are false.

162. Plaintiffs Bourn, Watson, and Verner and the California Subclass members have suffered harm as a result of these violations.

163. Plaintiffs Bourn, Watson, and Verner and California Subclass members have suffered harm as a result of Volkswagen's unlawful conduct because they purchased the Class Vehicles believing, based on Volkswagen's representations, that the Class Vehicles had certain characteristics that made them environmentally friendly, fuel efficient and high performance, when in fact these vehicles cannot have these fuel efficient and performance standards because their emissions do not comply with federal and state laws and regulations. These misrepresentations also resulted in higher purchase prices for the Class Vehicles and the subsequent revelation

VW FOIA, EPA 06/20/2017 2017-FFP_034259

concerning the "defeat devices" will result in lower resale value.

164. Volkswagen concealed from Plaintiffs Bourn, Watson, and Verner accurate information concerning the emissions standards, fuel efficiency and performance of the California Subclass Vehicles.

165. Volkswagen's misrepresentations and omissions described in the preceding paragraphs were intentional, or alternatively, made without the use of reasonable procedures adopted to avoid such errors.

166. Volkswagen, directly or indirectly, has engaged in substantially similar conduct with respect to Plaintiffs Bourn, Watson, and Verner and to each member of the California Subclass.

167. Unless Volkswagen is enjoined from engaging in such wrongful actions and conduct in the future, members of the consuming public will be further damaged by Volkswagen's conduct.

168. Plaintiffs Bourn, Watson, and Verner and the Class are entitled to equitable relief on behalf of the members of the California Subclass in the form of an order, pursuant to Civil Code §1780, subdivision (a)(2)-(5), prohibiting Volkswagen from continuing to engage in the above-described violations of the CLRA. Plaintiffs Bourn, Watson, and Verner and the California Subclass further seek reasonable attorneys' fees under Civil Code §1780(e).

SIXTH CLAIM

Violation of California Unfair Competition Law (Cal. Bus. & Prof. Code § 17200, *et seq.*)

169. Plaintiffs Bourn, Watson, and Verner incorporate by reference each preceding and succeeding paragraph.

170. Plaintiffs Bourn, Watson, and Verner bring this Claim on behalf of the California Subclass.

171. California Business & Professions Code §17200, *et seq.* prohibits acts of "unfair competition" which is defined by California Business & Professions Code § 17200 as including

VW FOIA, EPA 06/20/2017 2017-FFP_034260

any "any unlawful, unfair or fraudulent business act or practice ...."

172. Volkswagen has violated and continues to violate California Business & Professions Code §17200's prohibition against engaging in "unlawful" business acts or practices, by, inter alia, the following:

- Violating the CAA and applicable regulations;
- Violating California's Air Pollution Control laws and applicable regulations;
- Violating the Sherman Act;
- Violating RICO;
- Violating the Magnuson-Moss Act;
- Violating the CLRA; and
- Violating California's False Advertising Law.

173. Volkswagen also acted fraudulently and unfairly for purposes of section 17200. Volkswagen's misrepresentations and omissions regarding the Class Vehicles' emissions, environmental standards, fuel efficiency, and performance in their advertising, public statements and marketing were a material factor in inducing Plaintiffs Bourn, Watson, and Verner to purchase their Class Vehicle. Plaintiffs Bourn, Watson, and Verner suffered injury in fact and lost money and/or property as a result of Volkswagen's unlawful business acts and practices and California Subclass members have suffered harm when each was required to pay a purchase price for their Class Vehicles which they never would have purchased if the true facts were known; or paid a price in excess of what a California Subclass member would have paid if Volkswagen had accurately disclosed the Class Vehicles' characteristics and in the form of decreased resale value of the Vehicles.

174. As a result of Volkswagen's violations of the California Business & Professions Code §17200, *et seq.*, Plaintiffs Bourn, Watson, and Verner and California Subclass members are entitled to equitable relief in the form of full restitution for the inflated sale price of the Vehicles.

VW FOIA, EPA 06/20/2017 2017-FFP_034261

175. Plaintiffs Bourn, Watson, and Verner and California Subclass members also seek an order enjoining Volkswagen from continuing their unlawful business practices and from such future conduct.

SEVENTH CLAIM

Violation of the California False Advertising Law (Cal. Bus. & Prof. Code § 17500, *et seq.*)

176. Plaintiffs Bourn, Watson, and Verner incorporate by reference each preceding and succeeding paragraph.

177. Plaintiffs Bourn, Watson, and Verner bring this Claim on behalf of the California Subclass.

178. Volkswagen violated California's False Advertising Law, Business & Professions Code §17500, *et seq.*by using false and misleading messages regarding the environmental friendliness, emissions, fuel efficiency and performance of the Class Vehicles in television, print, and Internet advertising.

179. These representations and/or omissions have deceived and are likely to deceive Plaintiffs Bourn, Watson, and Verner, the California Subclass, and consumers across the country in connection with their decision to purchase Class Vehicles. Volkswagen's representations and/or omissions were material and constituted a substantial and material factor in Plaintiffs Bourn and Watson's decision to purchase their Class Vehicle. Had Plaintiffs Bourn, Watson, and Verner known the actual facts, they would not have purchased the Class Vehicles and/or paid more than they would have had Volkswagen accurately disclosed the Class Vehicles' true characteristics.

180. Volkswagen directly and indirectly, has engaged in substantially similar conduct with respect to each Plaintiff and to each member of the California Subclass.

181. Plaintiffs Bourn, Watson, and Verner suffered injury in fact and lost money and/or property as a result of Volkswagen's false and misleading advertising and California Subclass members suffered harm when each was required to pay a purchase price in excess of what a

VW FOIA, EPA 06/20/2017 2017-FFP_034262

California Subclass member would have paid if Volkswagen had accurately disclosed the Class Vehicles' characteristics and in the form of decreased resale value of the Class Vehicles.

182. As a result of Volkswagen's violations, Plaintiffs Bourn, Watson, and Verner and California Subclass members are entitled to equitable relief in the form of full restitution of all monies paid for the sales price of the Vehicles, diminished value of the Class Vehicles, and/or disgorgement of the profits derived from Volkswagen's false and misleading advertising.

183. Plaintiffs Bourn, Watson, and Verner also seek an order enjoining Volkswagen from such future conduct.

EIGHTH CLAIM

Violation of the Virginia Consumer Protection Act (Va. Code Ann. §§59.1-196, *et seq.*)

184. Plaintiff Schumacher incorporates by reference each preceding and succeeding paragraph.

185. Plaintiff Schumacher brings this Claim on behalf of the Virginia Subclass, which is cognizable in this Court pursuant to *Shady Grove Orthopedic Assocs., P.A. v. Allstate Ins. Co.*, 559 U.S. 393 (2010).

186. Defendants are "persons" within the meaning of Va. Code Ann. §59.1-200(A).

187. Volkswagen violated the Virginia Consumer Protection Act, which prohibits "...(5) misrepresenting that goods or services have certain quantities, characteristics, ingredients, uses, or benefits; (6) misrepresenting that goods or services are of a particular standard, quality, grade, style, or model; ... (8) advertising goods or services with intent not to sell them as advertised ...; [and] (14) using any other deception, fraud, false pretense, false promise, or misrepresentation in connection with a consumer transaction[.]" Va. Code Ann. §59.1-200(A).

188. These representations and/or omissions have deceived and are likely to deceive Plaintiff Schumacher, the Virginia Subclass, and consumers across the country in connection with their decision to purchase Class Vehicles. Volkswagen's representations and/or omissions were material and constituted a substantial and material factor in Plaintiff Schumacher's decision to

VW FOIA, EPA 06/20/2017 2017-FFP_034263

purchase their Class Vehicle. Had Plaintiff Schumacher and Virginia Subclass members known the actual facts, they would not have purchased the Class Vehicles and/or would have paid less for them.

189. Volkswagen, directly and indirectly, has engaged in substantially similar conduct with respect to each Plaintiff and to each member of the Virginia Subclass.

190. Plaintiff Schumacher and Virginia Subclass members suffered injury in fact and lost money and/or property as a result of Volkswagen's Violations of the Virginia Consumer Protection Act. Plaintiff Schumacher and Virginia Subclass members suffered harm when each was required to pay a purchase price in excess of what they would have paid if Volkswagen had accurately disclosed the Class Vehicles' characteristics; they also suffered harm in the form of decreased resale value of the Class Vehicles.

191. As a result of Volkswagen's violations, Plaintiff Schumacher and Virginia Subclass members are entitled to three times the amount of actual damages or $1000, whichever is greater, as well as costs and attorneys' fees. Va. Code Ann. §§59.1-204(a), (b).

NINTH CLAIM
Unjust Enrichment

192. Plaintiffs incorporate by reference each preceding and succeeding paragraph.

193. Plaintiffs bring this claim for unjust enrichment on behalf of the nationwide Class under the common law of unjust enrichment, as there are no true conflicts (case-dispositive differences) among various states' laws of unjust enrichment.

194. In the alternative, Plaintiffs bring this claim on behalf of the nationwide Class under Virginia law, because the Defendants' United States operations are headquartered in Virginia and Virginia has the most significant relationship to the issues and facts relevant to this claim.

195. Volkswagen received and retained a benefit from the Plaintiffs and inequity has resulted.

196. Volkswagen benefitted through its unjust conduct, by selling Class Vehicles subject

VW FOIA, EPA 06/20/2017 2017-FFP_034264

to the misrepresentation that they were EPA- and/or CARB-compliant and by failing to disclose its use of a defeat device in these vehicles.

197. Plaintiffs, were charged a premium based on this misrepresentation, overpaid for these vehicles as a result, and/or would not have purchased these vehicles at all had their noncompliance with federal and state emissions laws been disclosed.

198. It is inequitable for Volkswagen to retain these benefits.

199. Plaintiffs do not have an adequate remedy at law.

200. As a result of Volkswagen's conduct, the amount of its unjust enrichment should be disgorged, in an amount to be proven at trial.

TENTH CLAIM
Unjust Enrichment

201. Plaintiffs incorporate by reference each preceding and succeeding paragraph.

202. Plaintiffs bring this claim for unjust enrichment on behalf of the nationwide Class under the common law of fraudulent concealment, as there are no true conflicts (case-dispositive differences) among various states' laws of fraudulent concealment.

203. In the alternative, Plaintiffs bring this claim on behalf of the nationwide Class under Virginia law, because the Defendants' United States operations are headquartered in Virginia and Virginia has the most significant relationship to the issues and facts relevant to this claim.

204. Volkswagen concealed and suppressed the material facts that the Class Vehicles did not comply with federal and state emissions laws and were spewing illegal amounts of NOx when they were represented to be EPA- and/or CARB-compliant. It also concealed and suppressed the material fact that the Class Vehicles were equipped with a defeat device that prevented their proper testing under laboratory conditions for compliance with federal and state emissions laws and regulations.

205. Volkswagen took the various steps described herein to effectuate that concealment, such as false advertising and in false statements of compliance with federal and state emissions

VW FOIA, EPA 06/20/2017 2017-FFP_034265

laws and regulations affixed to each of the Class Vehicles

206. Volkswagen took steps to ensure that its employees did not reveal these concealed facts to federal and state environmental regulators.

207. Volkswagen had a duty to disclose the concealed information because it:

- Had exclusive and/or far superior knowledge and access to the facts than Plaintiffs and Class Members, and it knew the facts were not known to or reasonably discoverable by Plaintiffs and the Class;
- Intentionally concealed the foregoing from Plaintiffs; and
- Made incomplete representations about the compliance of the Class Vehicles with federal and state emissions laws and regulations, while purposefully withholding material facts from Plaintiffs that contradicted these representations.

208. These omitted and concealed facts were material because they would be relied on by a reasonable person purchasing, leasing or retaining the Class Vehicles, and because they directly impact the price paid for the Class Vehicles and their resale value. Whether the Class Vehicles comply with federal and state emissions laws and regulations is a material concern to a consumer. Plaintiffs and Class Members trusted Volkswagen not to sell or lease them vehicles that were non-compliant.

209. Volkswagen concealed and suppressed these material facts to falsely assure purchasers and consumers that the Class Vehicles complied with federal and state emissions laws and regulations, as represented by Volkswagen and reasonably expected by consumers.

210. Volkswagen actively concealed and/or suppressed these material facts, in whole or in part, to protect its profits and to avoid recalls that would hurt the brand image of the Class Vehicles and cost Volkswagen money. Volkswagen concealed these facts at the expense of Plaintiffs and the Class.

211. Plaintiffs and the Class were unaware of these omitted material facts, and would not have acted as they did if they had known of the concealed and/or suppressed information.

VW FOIA, EPA 06/20/2017 2017-FFP_034266

212. Had they been aware of the non-compliance of the Class Vehicles with federal and state emissions laws and regulations and Volkswagen's callous disregard for those laws and regulations, Plaintiffs and the Class either would have paid less for their Class Vehicles or would not have purchased or leased them at all. Plaintiffs did not receive the benefit of their bargain as a result of Volkswagen's fraudulent concealment.

213. Because of the concealment and/or suppression of the facts, Plaintiffs and the Class sustained damage because they own vehicles that diminished in value as a result of Volkswagen's concealment of, and failure to timely disclose, the non-compliance of the Class Vehicles with federal and state emissions laws and regulations.

214. The value of all Class members' Class Vehicles has diminished as a result of Volkswagen's fraudulent concealment of the non-compliance of the Class Vehicles with federal and state emissions laws and regulations and has made any reasonable consumer reluctant to purchase any of the Class Vehicles, let alone pay what otherwise would have been fair market value for the vehicles.

215. Accordingly, Volkswagen is liable to the Class for their damages in an amount to be proven at trial.

216. Volkswagen's acts were done maliciously, oppressively, deliberately, with intent to defraud, and in reckless disregard of Plaintiffs' and the Class's rights and well-being, and with the aim of enriching Volkswagen. Volkswagen's conduct, which exhibits the highest degree of reprehensibility, being intentional, continuous, placing others at risk of death and injury, and affecting public safety, warrants an assessment of punitive damages in an amount sufficient to deter such conduct in the future, which amount is to be determined according to proof.

PRAYER FOR RELIEF

WHEREFORE, Plaintiffs pray that the Court enter judgment on their behalf and on behalf of the Class and the California and Virginia Subclasses, and:

A. Order the appointment of an independent External Compliance Monitor to monitor

VW FOIA, EPA 06/20/2017 2017-FFP_034267

Volkswagen's compliance with federal and state environmental laws;

B. Order Volkswagen to pay a portion of its annual net profits into an independent fund administered by third parties approved by the Court who can disburse the funds to non-profit organizations that seek to monitor, educate people about, and/or remediate the deleterious environmental effects of vehicular diesel fuel emissions;

C. Order that this action may proceed as a class action, with Plaintiffs as the designated Class representatives for the Class; Plaintiffs Bourn, Watson, and Verner as designated Class representatives for the California Subclass; Plaintiff Schumacher as designated Class representative for the Virginia Subclass, and Plaintiffs' counsel as Class and Subclass Counsel;

D. Adjudge and decree that Volkswagen has violated the CAA, California Pollution Control laws, the Sherman Act, RICO, the Magnuson-Moss Act, the CLRA, California's Unfair Competition Law, California's False Advertising Law; the Virginia Consumer Protection Act, and the common law of unjust enrichment and fraudulent concealment and that Plaintiffs and the members of the Class and the California and Virginia Subclasses have been injured in their business and property as a result of Volkswagen's violations;

E. Order that Plaintiffs and the members of the National Class and California Subclass recover damages sustained by them, to the extent provided by law, and that a judgment in favor of Plaintiffs and the Class and the California and Virginia Subclasses be entered against Volkswagen in an amount to be trebled in accordance with such laws;

F. To the extent provided by law, enjoin and restrain Volkswagen, its subsidiaries, affiliates, successors, transferees, assignees and the respective officers, directors, partners, agents, and employees thereof and all other persons acting or claiming to act on their behalf from continuing to violate the CAA, California Pollution Control laws, the Sherman Act, RICO, the Magnuson-Moss Act, CLRA, California's Unfair Competition Law, California's False Advertising Law, the Virginia Consumer Protection Act, and the common law of unjust enrichment and fraudulent concealment;

VW FOIA, EPA 06/20/2017 2017-FFP_034268

G. Order Volkswagen to pay restitution or damages to Plaintiffs and members of the Class and the California and Virginia Subclasses and to disgorge the profits unlawfully acquired and retained by Volkswagen;

H. Award Plaintiffs and members of the Class and the California and Virginia Subclasses pre-judgment and post-judgment interest, and order that such interest be awarded at the highest legal rate from and after the date of service of the initial complaint in this action;

I. Award Plaintiffs and members of the Class and the California and Virginia Subclasses their costs of this suit, including reasonable attorneys' fees as provided by law; and

J. Order such other or further relief as may be just and proper.

IX. JURY TRIAL DEMAND.

Pursuant to Federal Rule of Civil Procedure 38(b), Plaintiffs demand a trial by jury of all of the claims asserted in this Complaint so triable.

Subject: 2107 VECI labels

Hello Jim,

1) We are developing 2017 VECI labels which identify interim Tier 3 standards. Does the abbreviation used below adequately describe the interim standard in your view?

	AUDI AG VEHICLE EMISSION CONTROL INFORMATION
Conforms to regulations:	2017 MY
U.S. EPA: IntT3B125 LDV OBD: CA II Fuel: Gasoline	
California: ULEV II PC OBD: CA II Fuel: Gasoline	
I stments needed.	DFI/AIR/2TC/CAC/2TWC/2WR-HO2S/2HO2S
Group: HVGAV04.0NUA Evap: HVGAR0155NAH	079 010 533 ?

Note – the Audi logo is misplaced in the label and I was unable to edit the drawing.

2) Can you update us on the progress of the A3 e-tron and A3 e-tron ultra Certificate of Conformity?

Regards,

Bill Rodgers

Volkswagen and Cheating Software

For the past six years, Volkswagen has been cheating on the emissions testing for its diesel cars. The cars' computers were able to detect when they were being tested, and temporarily alter how their engines worked so they looked much cleaner than they actually were. When they weren't being tested, they belched out 40 times the pollutants. Their CEO has resigned, and the company will face an expensive recall, enormous fines and worse.

Cheating on regulatory testing has a long history in corporate America. It happens regularly in automobile emissions control and elsewhere. What's important in the VW case is that the cheating was preprogrammed into the algorithm that controlled cars' emissions.

Computers allow people to cheat in ways that are new. Because the cheating is encapsulated in software, the malicious actions can happen at a far remove from the testing itself. Because the software is "smart" in ways that normal objects are not, the cheating can be subtler and harder to detect.

We've already had examples of smartphone manufacturers cheating on processor benchmark testing: detecting when they're being tested and artificially increasing their performance. We're going to see this in other industries.

The Internet of Things is coming. Many industries are moving to add computers to their devices, and that will bring with it new opportunities for manufacturers to cheat. Light bulbs could fool regulators into appearing more energy efficient than they are. Temperature sensors could fool buyers into believing that food has been stored at safer temperatures than it has been. Voting machines could appear to work perfectly -- except during the first Tuesday of November, when they undetectably switch a few percent of votes from one party's candidates to another's.

My worry is that some corporate executives won't interpret the VW story as a cautionary tale involving just punishments for a bad mistake but will see it instead as a demonstration that you can get away with something like that for six years.

And they'll cheat smarter. For all of VW's brazenness, its cheating was obvious once people knew to look for it. Far cleverer would be to make the cheating look like an accident. Overall software quality is so bad that products ship with thousands of programming mistakes.

Most of them don't affect normal operations, which is why your software generally works just fine. Some of them do, which is why your software occasionally fails, and needs constant updates. By making cheating software appear to be a programming mistake, the cheating looks like an

accident. And, unfortunately, this type of deniable cheating is easier than people think.

Computer-security experts believe that intelligence agencies have been doing this sort of thing for years, both with the consent of the software developers and surreptitiously.

This problem won't be solved through computer security as we normally think of it. Conventional computer security is designed to prevent outside hackers from breaking into your computers and networks. The car analogue would be security software that prevented an owner from tweaking his own engine to run faster but in the process emit more pollutants. What we need to contend with is a very different threat: malfeasance programmed in at the design stage.

We already know how to protect ourselves against corporate misbehavior. Ronald Reagan once said "trust, but verify" when speaking about the Soviet Union cheating on nuclear treaties. We need to be able to verify the software that controls our lives.

Software verification has two parts: transparency and oversight. Transparency means making the source code available for analysis. The need for this is obvious; it's much easier to hide cheating software if a manufacturer can hide the code.

But transparency doesn't magically reduce cheating or improve software quality, as anyone who uses open-source software knows. It's only the first step. The code must be analyzed. And because software is so complicated, that analysis can't be limited to a once-every-few-years government test. We need private analysis as well.

It was researchers at private labs in the United States and Germany that eventually outed Volkswagen. So transparency can't just mean making the code available to government regulators and their representatives; it needs to mean making the code available to everyone.

Both transparency and oversight are being threatened in the software world. Companies routinely fight making their code public and attempt to muzzle security researchers who find problems, citing the proprietary nature of the software. It's a fair complaint, but the public interests of accuracy and safety need to trump business interests.

Proprietary software is increasingly being used in critical applications: voting machines, medical devices, breathalyzers, electric power distribution, systems that decide whether or not someone can board an airplane. We're ceding more control of our lives to software and algorithms. Transparency is the only way verify that they're not cheating us.

There's no shortage of corporate executives willing to lie and cheat their way to profits. We saw another example of this last week: Stewart Parnell, the former CEO of the now-defunct Peanut Corporation of America, was sentenced to 28 years in prison for knowingly shipping out salmonella-tainted products. That may seem excessive, but nine people died and many more fell ill as a result of his cheating.

Software will only make malfeasance like this easier to commit and harder to prove. Fewer people need to know about the conspiracy. It can be done in advance, nowhere near the testing time or site. And, if the software remains undetected for long enough, it could easily be the case

that no one in the company remembers that it's there.

We need better verification of the software that controls our lives, and that means more -- and more public -- transparency.

Living in a Code Yellow World

In the 1980s, handgun expert Jeff Cooper invented something called the Color Code to describe what he called the "combat mind-set." Here is his summary:

> In White you are unprepared and unready to take lethal

> action. If you are attacked in White you will probably die unless your adversary is totally inept.
>
> In Yellow you bring yourself to the understanding that your life may be in danger and that you may have to do something about it.
>
> In Orange you have determined upon a specific adversary and are prepared to take action which may result in his death, but you are not in a lethal mode.
>
> In Red you are in a lethal mode and will shoot if circumstances warrant.

Cooper talked about remaining in Code Yellow over time, but he didn't write about its psychological toll. It's significant. Our brains can't be on that alert level constantly. We need downtime. We need to relax. This is why we have friends around whom we can let our guard down and homes where we can close our doors to outsiders. We only want to visit Yellowland occasionally.

Since 9/11, the US has increasingly become Yellowland, a place where we assume danger is imminent. It's damaging to us individually and as a society.

I don't mean to minimize actual danger. Some people really do live in a Code Yellow world, due to the failures of government in their home countries. Even there, we know how hard it is for them to maintain a constant level of alertness in the face of constant danger. Psychologist Abraham Maslow wrote about this, making safety a basic level in his hierarchy of needs. A lack of safety makes people anxious and tense, and the long term effects are debilitating.

The same effects occur when we believe we're living in an unsafe situation even if we're not. The psychological term for this is hypervigilance. Hypervigilance in the face of imagined danger causes stress and anxiety. This, in turn, alters how your hippocampus functions, and causes an excess of cortisol in your body. Now cortisol is great in small and infrequent doses, and helps you run away from tigers. But it destroys your brain and body if you marinate in it for extended periods of time.

Not only does trying to live in Yellowland harm you physically, it changes how you interact with your environment and it impairs your judgment. You forget what's normal and start seeing the enemy everywhere. Terrorism actually relies on this kind of reaction to succeed.

Here's an example from The Washington Post last year: "I was taking pictures of my daughters. A stranger thought I was exploiting them." A father wrote about his run-in with an off-duty DHS agent, who interpreted an innocent family photoshoot as something nefarious and proceeded to harass and lecture the family. That the parents were white and the daughters Asian added a racist element to the encounter.

At the time, people wrote about this as an example of worst-case thinking, saying that as a DHS agent, "he's paid to suspect the worst at all times and butt in." While, yes, it was a "disturbing reminder of how the mantra of 'see something, say something' has muddied the waters of what constitutes suspicious activity," I think there's a deeper story

here. The agent is trying to live his life in Yellowland, and it caused him to see predators where there weren't any.

I call these "movie-plot threats," scenarios that would make great action movies but that are implausible in real life. Yellowland is filled with them.

Last December former DHS director Tom Ridge wrote about the security risks of building a NFL stadium near the Los Angeles Airport. His report is full of movie-plot threats, including terrorists shooting down a plane and crashing it into a stadium. His conclusion, that it is simply too dangerous to build a sports stadium within a few miles of the airport, is absurd. He's been living too long in Yellowland.

That our brains aren't built to live in Yellowland makes sense, because actual attacks are rare. The person walking towards you on the street isn't an attacker. The person doing something unexpected over there isn't a terrorist. Crashing an airplane into a sports stadium is more suitable to a Die Hard movie than real life. And the white man taking pictures of two Asian teenagers on a ferry isn't a sex slaver. (I mean, really?)

Most of us, that DHS agent included, are complete amateurs at knowing the difference between something benign and something that's actually dangerous. Combine this with the rarity of attacks, and you end up with an overwhelming number of false alarms. This is the ultimate problem with programs like "see something, say something." They waste an enormous amount of time and money.

Those of us fortunate enough to live in a Code White society are much better served acting like we do. This is something we need to learn at all levels, from our personal interactions to our national policy. Since the terrorist attacks of 9/11, many of our counterterrorism policies have helped convince people they're not safe, and that they need to be in a constant state of readiness. We need our leaders to lead us out of Yellowland, not to perpetuate it.

Obama Administration Not Pursuing a Backdoor to Commercial Encryption

The Obama Administration is not pursuing a law that would force computer and communications manufacturers to add backdoors to their products for law enforcement. Sensibly, they concluded that criminals, terrorists, and foreign spies would use that backdoor as well.

Score one for the pro-security side in the Second Crypto War.

It's certainly not over. The FBI hasn't given up on an encryption backdoor (or other backdoor access to plaintext) since the early 1990s, and it's not going to give up now. I expect there will be more pressure on companies, both overt and covert, more insinuations that strong security is somehow responsible for crime and terrorism, and more behind-closed-doors negotiations.

A rural New Hampshire library decided to install Tor on their computers and allow anonymous Internet browsing. The Department of Homeland pressured them to stop.
https://www.propublica.org/article/library-support-anonymous-internet-browsing-effort-stops-after-dhs-email
The good news is that the library is resisting the pressure and keeping Tor running.
http://www.vnews.com/home/18620952-95/despite-law-enforcement-concerns-lebanon-board-will-reactivate-privacy-network-tor-at-kilton-library
http://www.theregister.co.uk/2015/09/17/library_freedom_project_dozen_more_tor_nodes/

This is an important issue for reasons that go beyond the New Hampshire library. The goal of the Library Freedom Project is to set up Tor exit nodes at libraries. Exit nodes help every Tor user in the world; the more of them there are, the harder it is to subvert the system. The Kilton Public Library isn't just allowing its patrons to browse the Internet anonymously; it is helping dissidents around the world stay alive.
https://libraryfreedomproject.org/torexitpilotphase1/
Librarians have been protecting our privacy for decades, and I'm happy to see that tradition continue.

Stealing Fingerprints

The news from the Office of Personnel Management hack keeps getting worse. In addition to the personal records of over 20 million US government employees, we've now learned that the hackers stole fingerprint files for 5.6 million of them.

This is fundamentally different from the data thefts we regularly read about in the news, and should give us pause before we entrust our biometric data to large networked databases.

There are three basic kinds of data that can be stolen. The first, and most common, is authentication credentials. These are passwords and other information that allows someone else access into our accounts and -- usually -- our money. An example would be the 56 million credit card numbers hackers stole from Home Depot in 2014, or the 21.5 million Social Security numbers hackers stole in the OPM breach. The motivation is typically financial. The hackers want to steal money from our bank accounts, process fraudulent credit card charges in our name, or open new lines of credit or apply for tax refunds.

It's a huge illegal business, but we know how to deal with it when it happens. We detect these hacks as quickly as possible, and update our account credentials as soon as we detect an attack. (We also need to stop treating Social Security numbers as if they were secret.)

The second kind of data stolen is personal information. Examples would be the medical data stolen and exposed when Sony was hacked in 2014, or the very personal data from the infidelity website Ashley Madison stolen and published this year. In these instances, there is no real way to recover after a breach. Once the data is public, or in the hands of an adversary, it's impossible to make it private again.

This is the main consequence of the OPM data breach. Whoever stole the data -- we suspect it was the Chinese -- got copies the security-clearance paperwork of all those government employees. This documentation includes the answers to some very personal and

embarrassing questions, and now opens these employees up to blackmail and other types of coercion.

Fingerprints are another type of data entirely. They're used to identify people at crime scenes, but increasingly they're used as an authentication credential. If you have an iPhone, for example, you probably use your fingerprint to unlock your phone. This type of authentication is increasingly common, replacing a password -- something you know -- with a biometric: something you are. The problem with biometrics is that they can't be replaced. So while it's easy to update your password or get a new credit card number, you can't get a new finger.

And now, for the rest of their lives, 5.6 million US government employees need to remember that someone, somewhere, has their fingerprints. And we really don't know the future value of this data. If, in twenty years, we routinely use our fingerprints at ATM machines, that fingerprint database will become very profitable to criminals. If fingerprints start being used on our computers to authorize our access to files and data, that database will become very profitable to spies.

Of course, it's not that simple. Fingerprint readers employ various technologies to prevent being fooled by fake fingers: detecting temperature, pores, a heartbeat, and so on. But this is an arms race between attackers and defenders, and there are many ways to fool fingerprint readers. When Apple introduced its iPhone fingerprint reader, hackers figured out how to fool it within days, and have continued to fool each new generation of phone readers equally quickly.

Not every use of biometrics requires the biometric data to be stored in a central server somewhere. Apple's system, for example, only stores the data locally: on your phone. That way there's no central repository to be hacked. And many systems don't store the biometric data at all, only a mathematical function of the data that can be used for authentication but can't be used to reconstruct the actual biometric. Unfortunately, OPM stored copies of actual fingerprints.

Ashley Madison has taught us all the dangers of entrusting our intimate secrets to a company's computers and networks, because once that data is out there's no getting it back. All biometric data, whether it be fingerprints, retinal scans, voiceprints, or something else, has that same property. We should be skeptical of any attempts to store this data en masse, whether by governments or by corporations. We need our biometrics for authentication, and we can't afford to lose them to hackers.

Automatic Face Recognition and Surveillance

ID checks were a common response to the terrorist attacks of 9/11, but they'll soon be obsolete. You won't have to show your ID, because you'll be identified automatically. A security camera will capture your face, and it'll be matched with your name and a whole lot of other information besides. Welcome to the world of automatic facial recognition. Those who have access to databases of identified photos will have the power to identify us. Yes, it'll enable some amazing personalized services; but it'll also enable whole new levels of surveillance. The underlying technologies are being developed today, and there are currently no rules limiting their use.

Walk into a store, and the salesclerks will know your name. The store's cameras and computers will have figured out your identity, and looked you up in both their store database and a commercial marketing database they've subscribed to. They'll know your name, salary, interests, what sort of sales pitches you're most vulnerable to, and how profitable a

customer you are. Maybe they'll have read a profile based on your tweets and know what sort of mood you're in. Maybe they'll know your political affiliation or sexual identity, both predictable by your social media activity. And they're going to engage with you accordingly, perhaps by making sure you're well taken care of or possibly by trying to make you so uncomfortable that you'll leave.

Walk by a policeman, and she will know your name, address, criminal record, and with whom you routinely are seen. The potential for discrimination is enormous, especially in low-income communities where people are routinely harassed for things like unpaid parking tickets and other minor violations. And in a country where people are arrested for their political views, the use of this technology quickly turns into a nightmare scenario.

The critical technology here is computer face recognition. Traditionally it has been pretty poor, but it's slowly improving. A computer is now as good as a person. Already Google's algorithms can accurately match child and adult photos of the same person, and Facebook has an algorithm that works by recognizing hair style, body shape, and body language -- and works even when it can't see faces. And while we humans are pretty much as good at this as we're ever going to get, computers will continue to improve. Over the next years, they'll continue to get more accurate, making better matches using even worse photos.

Matching photos with names also requires a database of identified photos, and we have plenty of those too. Driver's license databases are a gold mine: all shot face forward, in good focus and even light, with accurate identity information attached to each photo. The enormous photo collections of social media and photo archiving sites are another. They contain photos of us from all sorts of angles and in all sorts of lighting conditions, and we helpfully do the identifying step for the companies by tagging ourselves and our friends. Maybe this data will appear on handheld screens. Maybe it'll be automatically displayed on computer-enhanced glasses. Imagine salesclerks -- or politicians -- being able to scan a room and instantly see wealthy customers highlighted in green, or policemen seeing people with criminal records highlighted in red.

Science fiction writers have been exploring this future in both books and movies for decades. Ads followed people from billboard to billboard in the movie Minority Report. In John Scalzi's recent novel Lock In, characters scan each other like the salesclerks I described above.

This is no longer fiction. High-tech billboards can target ads based on the gender of who's standing in front of them. In 2011, researchers at Carnegie Mellon pointed a camera at a public area on campus and were able to match live video footage with a public database of tagged photos in real time. Already government and commercial authorities have set up facial recognition systems to identify and monitor people at sporting events, music festivals, and even churches. The Dubai police are working on integrating facial recognition into Google Glass, and more US local police forces are using the technology.

Facebook, Google, Twitter, and other companies with large databases of tagged photos know how valuable their archives are. They see all kinds of services powered by their technologies -- services they can sell to businesses like the stores you walk into and the governments you might interact with.

Other companies will spring up whose business models depend on capturing our images in public and selling them to whoever has use for them. If you think this is farfetched, consider a related technology that's already far down that path: license-plate capture.

Today in the US there's a massive but invisible industry that records the movements of cars around the country. Cameras mounted on cars and tow trucks capture license places along with date/time/location information, and companies use that data to find cars that are scheduled for repossession. One company, Vigilant Solutions, claims to collect 70 million scans in the US every month. The companies that engage in this business routinely share that data with the police, giving the police a steady stream of surveillance information on innocent people that they could not legally collect on their own. And the companies are already looking for other profit streams, selling that surveillance data to anyone else who thinks they have a need for it.

This could easily happen with face recognition. Finding bail jumpers could even be the initial driving force, just as finding cars to repossess was for license plate capture.

Already the FBI has a database of 52 million faces, and describes its integration of facial recognition software with that database as "fully operational." In 2014, FBI Director James Comey told Congress that the database would not include photos of ordinary citizens, although the FBI's own documents indicate otherwise. And just last month, we learned that the FBI is looking to buy a system that will collect facial images of anyone an officer stops on the street.

In 2013, Facebook had a quarter of a trillion user photos in its database. There's currently a class-action lawsuit in Illinois alleging that the company has over a billion "face templates" of people, collected without their knowledge or consent.

Last year, the US Department of Commerce tried to prevail upon industry representatives and privacy organizations to write a voluntary code of conduct for companies using facial recognition technologies. After 16 months of negotiations, all of the consumer-focused privacy organizations pulled out of the process because industry representatives were unable to agree on any limitations on something as basic as nonconsensual facial recognition.

When we talk about surveillance, we tend to concentrate on the problems of data collection: CCTV cameras, tagged photos, purchasing habits, our writings on sites like Facebook and Twitter. We think much less about data analysis. But effective and pervasive surveillance is just as much about analysis. It's sustained by a combination of cheap and ubiquitous cameras, tagged photo databases, commercial databases of our actions that reveal our habits and personalities, and -- most of all -- fast and accurate face recognition software.

Don't expect to have access to this technology for yourself anytime soon. This is not facial recognition for all. It's just for those who can either demand or pay for access to the required technologies -- most importantly, the tagged photo databases. And while we can easily imagine how this might be misused in a totalitarian country, there are dangers in free societies as well. Without meaningful regulation, we're moving into a world where governments and corporations will be able to identify people both in real time and backwards in time, remotely and in secret, without consent or recourse.

Despite protests from industry, we need to regulate this budding industry. We need limitations on how our images can be collected without our knowledge or consent, and on how they can be used. The technologies aren't going away, and we can't uninvent these capabilities. But we can ensure that they're used ethically and responsibly, and not just as a mechanism to increase police and corporate power over us.

Resilient Systems News

Former Raytheon CEO Bill Swanson has joined our board of directors.

For those who don't know, Resilient Systems is my company. I'm the CTO, and we sell an incident-response management platform that...well...helps IR teams to manage incidents. It's a single hub that allows a team to collect data about an incident, assign and manage tasks, automate actions, integrate intelligence information, and so on. It's designed to be powerful, flexible, and intuitive -- if your HR or legal person needs to get involved, she has to be able to use it without any training. I'm

really impressed with how well it works. Incident response is all about people, and the platform makes teams more effective. This is probably the best description of what we do.

We have lots of large- and medium-sized companies as customers. They're all happy, and we continue to sell this thing at an impressive rate. Our Q3 numbers were fantastic. It's kind of scary, really.

http://fortune.com/2015/09/28/raytheon-chief-joins-resilient/

Bringing Frozen Liquids through Airport Security

Gizmodo reports that UK airport security confiscates frozen liquids:

> "He told me that it wasn't allowed so I asked under what grounds, given it is not a liquid. When he said I couldn't take it I asked if he knew that for sure or just assumed. He grabbed his supervisor and the supervisor told me that 'the government does not classify that as a solid'. I decided to leave it at that point. I expect they're probably wrong to take it from me. They'd probably not seen it before, didn't know the rules, and being a bit of an eccentric request, decided to act on the side of caution. They didn't spend the time to look it up."

As it happens, I have a comparable recent experience. Last week, I tried to bring through a small cooler containing, among other things, a bag of ice. I expected to have to dump the ice at the security checkpoint and refill it inside the airport, but the TSA official looked at it and let it through. Turns out that frozen liquids are fine. I confirmed this with TSA officials at two other airports this week.

One of the TSA officials even told me that what he was officially told is that liquid explosives don't freeze.

So there you go. The US policy is more sensible. And anyone landing in the UK from the US will have to go through security before any onward flight, so there's no chance at flouting the UK rules that way.

And while we're on the general subject, I am continually amazed by how lax the liquid rules are here in the US. Yesterday I went through airport security at SFO with an opened 5-ounce bottle of hot sauce in my carry-on. The screener flagged it; it was obvious on the x-ray. Another screener searched my bag, found it and looked at it, and then let me keep it.

And, in general, I never bother taking my liquids out of my suitcase anymore. I don't have to when I am in the PreCheck lane, but no one seems to care in the regular lane, either. It is different in the UK.

http://gizmodo.com/what-happens-if-you-take-frozen-liquids-through-airport-1729772148

According to a TSA blog post, frozen ice (not semi-melted) is allowed:
http://blog.tsa.gov/2009/11/response-to-tsa-takes-big-gulp-over.html

Hannibal Burgess routine about the TSA liquids rules.

SHA-1 Freestart Collision

There's a new cryptanalysis result against the hash function SHA-1:

> Abstract: We present in this article a freestart collision example for SHA-1, i.e., a collision for its internal compression function. This is the first practical break of the full SHA-1, reaching all 80 out of 80 steps, while only 10 days of computation on a 64 GPU cluster were necessary to perform the attack. This work builds on a continuous series of cryptanalytic advancements on SHA-1 since the theoretical collision attack breakthrough in 2005. In particular, we extend the recent freestart collision work on reduced-round SHA-1 from CRYPTO 2015 that leverages the computational power of graphic cards and adapt it to allow the use of boomerang speed-up techniques. We also leverage the cryptanalytic techniques by Stevens from EUROCRYPT 2013 to obtain optimal attack conditions, which required further refinements for this work. Freestart collisions, like the one presented here, do not directly imply a collision for SHA-1.
>
> However, this work is an important milestone towards an actual SHA-1 collision and it further shows how graphics cards can be used very efficiently for these kind of attacks. Based on the state-of-the-art collision attack on SHA-1 by Stevens from EUROCRYPT 2013, we are able to present new projections on the computational/financial cost required by a SHA-1 collision computation. These projections are significantly lower than previously anticipated by the industry, due to the use of the more cost efficient graphics cards compared to regular CPUs. We therefore recommend the industry, in particular Internet browser vendors and Certification Authorities, to retract SHA-1 soon. We hope the industry has learned from the events surrounding the cryptanalytic breaks of MD5 and will retract SHA-1 before example signature forgeries appear in the near future. With our new cost projections in mind, we strongly and urgently recommend against a recent proposal to extend the issuance of SHA-1 certificates by a year in the CAB/forum (the vote closes on October 16 2015 after a discussion period ending on October 9).

Especially note this bit: "Freestart collisions, like the one presented here, do not directly imply a collision for SHA-1. However, this work is an important milestone towards an actual SHA-1 collision and it further shows how graphics cards can be used very efficiently for these kind of attacks." In other words: don't panic, but prepare for a future panic.

This is not that unexpected. We've long known that SHA-1 is broken, at

least theoretically. All the major browsers are planning to stop accepting SHA-1 signatures by 2017. Microsoft is retiring it on that same schedule. What's news is that our previous estimates may be too conservative.

There's a saying inside the NSA: "Attacks always get better; they never get worse." This is obviously true, but it's worth explaining why. Attacks get better for three reasons. One, Moore's Law means that computers are always getting faster, which means that any cryptanalytic attack gets faster. Two, we're forever making tweaks in existing attacks, which make them faster. (Note above: "...due to the use of the more cost efficient graphics cards compared to regular CPUs.") And three, we regularly invent new cryptanalytic attacks. The first of those is generally predictable, the second is somewhat predictable, and the third is not at all predictable.

Way back in 2004, I wrote: "It's time for us all to migrate away from SHA-1." Since then, we have developed an excellent replacement: SHA-3 has been agreed on since 2012, and just became a standard.

This new result is important right now:

> Thursday's research showing SHA1 is weaker than previously thought comes as browser developers and certificate authorities are considering a proposal that would extend the permitted issuance of the SHA1-based HTTPS certificates by 12 months, that is through the end of 2016 rather than no later than January of that year. The proposal argued that some large organizations currently find it hard to move to a more secure hashing algorithm for their digital certificates and need the additional year to make the transition.

As the paper's authors note, approving this proposal is a bad idea.

Volkswagen and Cheating Software

For the past six years, Volkswagen has been cheating on the emissions testing for its diesel cars. The cars' computers were able to detect when they were being tested, and temporarily alter how their engines worked so they looked much cleaner than they actually were. When they weren't being tested, they belched out 40 times the pollutants. Their CEO has resigned, and the company will face an expensive recall, enormous fines and worse.

Cheating on regulatory testing has a long history in corporate America. It happens regularly in automobile emissions control and elsewhere. What's important in the VW case is that the cheating was preprogrammed into the algorithm that controlled cars' emissions.

Computers allow people to cheat in ways that are new. Because the cheating is encapsulated in software, the malicious actions can happen at a far remove from the testing itself. Because the software is "smart" in ways that normal objects are not, the cheating can be subtler and harder to detect.

We've already had examples of smartphone manufacturers cheating on processor benchmark testing: detecting when they're being tested and artificially increasing their performance. We're going to see this in other industries.

The Internet of Things is coming. Many industries are moving to add computers to their devices, and that will bring with it new opportunities for manufacturers to cheat. Light bulbs could fool regulators into appearing more energy efficient than they are. Temperature sensors could fool buyers into believing that food has been stored at safer temperatures than it has been. Voting machines could appear to work perfectly -- except during the first Tuesday of November, when they undetectably switch a few percent of votes from one party's candidates to another's.

My worry is that some corporate executives won't interpret the VW story as a cautionary tale involving just punishments for a bad mistake but will see it instead as a demonstration that you can get away with something like that for six years.

And they'll cheat smarter. For all of VW's brazenness, its cheating was obvious once people knew to look for it. Far cleverer would be to make the cheating look like an accident. Overall software quality is so bad that products ship with thousands of programming mistakes.

Most of them don't affect normal operations, which is why your software generally works just fine. Some of them do, which is why your software occasionally fails, and needs constant updates. By making cheating software appear to be a programming mistake, the cheating looks like an

accident. And, unfortunately, this type of deniable cheating is easier than people think.

Computer-security experts believe that intelligence agencies have been doing this sort of thing for years, both with the consent of the software developers and surreptitiously.

This problem won't be solved through computer security as we normally think of it. Conventional computer security is designed to prevent outside hackers from breaking into your computers and networks. The car analogue would be security software that prevented an owner from tweaking his own engine to run faster but in the process emit more pollutants. What we need to contend with is a very different threat: malfeasance programmed in at the design stage.

We already know how to protect ourselves against corporate misbehavior. Ronald Reagan once said "trust, but verify" when speaking about the Soviet Union cheating on nuclear treaties. We need to be able to verify the software that controls our lives.

Software verification has two parts: transparency and oversight. Transparency means making the source code available for analysis. The need for this is obvious; it's much easier to hide cheating software if a manufacturer can hide the code.

But transparency doesn't magically reduce cheating or improve software quality, as anyone who uses open-source software knows. It's only the first step. The code must be analyzed. And because software is so complicated, that analysis can't be limited to a once-every-few-years government test. We need private analysis as well.

It was researchers at private labs in the United States and Germany that eventually outed Volkswagen. So transparency can't just mean making the code available to government regulators and their representatives; it needs to mean making the code available to everyone.

Both transparency and oversight are being threatened in the software world. Companies routinely fight making their code public and attempt to muzzle security researchers who find problems, citing the proprietary nature of the software. It's a fair complaint, but the public interests of accuracy and safety need to trump business interests.

Proprietary software is increasingly being used in critical applications: voting machines, medical devices, breathalyzers, electric power distribution, systems that decide whether or not someone can board an airplane. We're ceding more control of our lives to software and algorithms. Transparency is the only way verify that they're not cheating us.

There's no shortage of corporate executives willing to lie and cheat their way to profits. We saw another example of this last week: Stewart Parnell, the former CEO of the now-defunct Peanut Corporation of America, was sentenced to 28 years in prison for knowingly shipping out salmonella-tainted products. That may seem excessive, but nine people died and many more fell ill as a result of his cheating.

Software will only make malfeasance like this easier to commit and harder to prove. Fewer people need to know about the conspiracy. It can be done in advance, nowhere near the testing time or site. And, if the software remains undetected for long enough, it could easily be the case

that no one in the company remembers that it's there.

We need better verification of the software that controls our lives, and that means more -- and more public -- transparency.

Living in a Code Yellow World

In the 1980s, handgun expert Jeff Cooper invented something called the Color Code to describe what he called the "combat mind-set." Here is his summary:

> In White you are unprepared and unready to take lethal

> action. If you are attacked in White you will probably die unless your adversary is totally inept.
>
> In Yellow you bring yourself to the understanding that your life may be in danger and that you may have to do something about it.
>
> In Orange you have determined upon a specific adversary and are prepared to take action which may result in his death, but you are not in a lethal mode.
>
> In Red you are in a lethal mode and will shoot if circumstances warrant.

Cooper talked about remaining in Code Yellow over time, but he didn't write about its psychological toll. It's significant. Our brains can't be on that alert level constantly. We need downtime. We need to relax. This is why we have friends around whom we can let our guard down and homes where we can close our doors to outsiders. We only want to visit Yellowland occasionally.

Since 9/11, the US has increasingly become Yellowland, a place where we assume danger is imminent. It's damaging to us individually and as a society.

I don't mean to minimize actual danger. Some people really do live in a Code Yellow world, due to the failures of government in their home countries. Even there, we know how hard it is for them to maintain a constant level of alertness in the face of constant danger. Psychologist Abraham Maslow wrote about this, making safety a basic level in his hierarchy of needs. A lack of safety makes people anxious and tense, and the long term effects are debilitating.

The same effects occur when we believe we're living in an unsafe situation even if we're not. The psychological term for this is hypervigilance. Hypervigilance in the face of imagined danger causes stress and anxiety. This, in turn, alters how your hippocampus functions, and causes an excess of cortisol in your body. Now cortisol is great in small and infrequent doses, and helps you run away from tigers. But it destroys your brain and body if you marinate in it for extended periods of time.

Not only does trying to live in Yellowland harm you physically, it changes how you interact with your environment and it impairs your judgment. You forget what's normal and start seeing the enemy everywhere. Terrorism actually relies on this kind of reaction to succeed.

Here's an example from The Washington Post last year: "I was taking pictures of my daughters. A stranger thought I was exploiting them." A father wrote about his run-in with an off-duty DHS agent, who interpreted an innocent family photoshoot as something nefarious and proceeded to harass and lecture the family. That the parents were white and the daughters Asian added a racist element to the encounter.

At the time, people wrote about this as an example of worst-case thinking, saying that as a DHS agent, "he's paid to suspect the worst at all times and butt in." While, yes, it was a "disturbing reminder of how the mantra of 'see something, say something' has muddied the waters of what constitutes suspicious activity," I think there's a deeper story

here. The agent is trying to live his life in Yellowland, and it caused him to see predators where there weren't any.

I call these "movie-plot threats," scenarios that would make great action movies but that are implausible in real life. Yellowland is filled with them.

Last December former DHS director Tom Ridge wrote about the security risks of building a NFL stadium near the Los Angeles Airport. His report is full of movie-plot threats, including terrorists shooting down a plane and crashing it into a stadium. His conclusion, that it is simply too dangerous to build a sports stadium within a few miles of the airport, is absurd. He's been living too long in Yellowland.

That our brains aren't built to live in Yellowland makes sense, because actual attacks are rare. The person walking towards you on the street isn't an attacker. The person doing something unexpected over there isn't a terrorist. Crashing an airplane into a sports stadium is more suitable to a Die Hard movie than real life. And the white man taking pictures of two Asian teenagers on a ferry isn't a sex slaver. (I mean, really?)

Most of us, that DHS agent included, are complete amateurs at knowing the difference between something benign and something that's actually dangerous. Combine this with the rarity of attacks, and you end up with an overwhelming number of false alarms. This is the ultimate problem with programs like "see something, say something." They waste an enormous amount of time and money.

Those of us fortunate enough to live in a Code White society are much better served acting like we do. This is something we need to learn at all levels, from our personal interactions to our national policy. Since the terrorist attacks of 9/11, many of our counterterrorism policies have helped convince people they're not safe, and that they need to be in a constant state of readiness. We need our leaders to lead us out of Yellowland, not to perpetuate it.

Obama Administration Not Pursuing a Backdoor to Commercial Encryption

The Obama Administration is not pursuing a law that would force computer and communications manufacturers to add backdoors to their products for law enforcement. Sensibly, they concluded that criminals, terrorists, and foreign spies would use that backdoor as well.

Score one for the pro-security side in the Second Crypto War.

It's certainly not over. The FBI hasn't given up on an encryption backdoor (or other backdoor access to plaintext) since the early 1990s, and it's not going to give up now. I expect there will be more pressure on companies, both overt and covert, more insinuations that strong security is somehow responsible for crime and terrorism, and more behind-closed-doors negotiations.

A rural New Hampshire library decided to install Tor on their computers and allow anonymous Internet browsing. The Department of Homeland pressured them to stop.
https://www.propublica.org/article/library-support-anonymous-internet-browsing-effort-stops-after-dhs-email
The good news is that the library is resisting the pressure and keeping Tor running.
http://www.vnews.com/home/18620952-95/despite-law-enforcement-concerns-lebanon-board-will-reactivate-privacy-network-tor-at-kilton-library
http://www.theregister.co.uk/2015/09/17/library_freedom_project_dozen_more_tor_nodes/

This is an important issue for reasons that go beyond the New Hampshire library. The goal of the Library Freedom Project is to set up Tor exit nodes at libraries. Exit nodes help every Tor user in the world; the more of them there are, the harder it is to subvert the system. The Kilton Public Library isn't just allowing its patrons to browse the Internet anonymously; it is helping dissidents around the world stay alive.
https://libraryfreedomproject.org/torexitpilotphase1/
Librarians have been protecting our privacy for decades, and I'm happy to see that tradition continue.

Stealing Fingerprints

The news from the Office of Personnel Management hack keeps getting worse. In addition to the personal records of over 20 million US government employees, we've now learned that the hackers stole fingerprint files for 5.6 million of them.

This is fundamentally different from the data thefts we regularly read about in the news, and should give us pause before we entrust our biometric data to large networked databases.

There are three basic kinds of data that can be stolen. The first, and most common, is authentication credentials. These are passwords and other information that allows someone else access into our accounts and -- usually -- our money. An example would be the 56 million credit card numbers hackers stole from Home Depot in 2014, or the 21.5 million Social Security numbers hackers stole in the OPM breach. The motivation is typically financial. The hackers want to steal money from our bank accounts, process fraudulent credit card charges in our name, or open new lines of credit or apply for tax refunds.

It's a huge illegal business, but we know how to deal with it when it happens. We detect these hacks as quickly as possible, and update our account credentials as soon as we detect an attack. (We also need to stop treating Social Security numbers as if they were secret.)

The second kind of data stolen is personal information. Examples would be the medical data stolen and exposed when Sony was hacked in 2014, or the very personal data from the infidelity website Ashley Madison stolen and published this year. In these instances, there is no real way to recover after a breach. Once the data is public, or in the hands of an adversary, it's impossible to make it private again.

This is the main consequence of the OPM data breach. Whoever stole the data -- we suspect it was the Chinese -- got copies the security-clearance paperwork of all those government employees. This documentation includes the answers to some very personal and

embarrassing questions, and now opens these employees up to blackmail and other types of coercion.

Fingerprints are another type of data entirely. They're used to identify people at crime scenes, but increasingly they're used as an authentication credential. If you have an iPhone, for example, you probably use your fingerprint to unlock your phone. This type of authentication is increasingly common, replacing a password -- something you know -- with a biometric: something you are. The problem with biometrics is that they can't be replaced. So while it's easy to update your password or get a new credit card number, you can't get a new finger.

And now, for the rest of their lives, 5.6 million US government employees need to remember that someone, somewhere, has their fingerprints. And we really don't know the future value of this data. If, in twenty years, we routinely use our fingerprints at ATM machines, that fingerprint database will become very profitable to criminals. If fingerprints start being used on our computers to authorize our access to files and data, that database will become very profitable to spies.

Of course, it's not that simple. Fingerprint readers employ various technologies to prevent being fooled by fake fingers: detecting temperature, pores, a heartbeat, and so on. But this is an arms race between attackers and defenders, and there are many ways to fool fingerprint readers. When Apple introduced its iPhone fingerprint reader, hackers figured out how to fool it within days, and have continued to fool each new generation of phone readers equally quickly.

Not every use of biometrics requires the biometric data to be stored in a central server somewhere. Apple's system, for example, only stores the data locally: on your phone. That way there's no central repository to be hacked. And many systems don't store the biometric data at all, only a mathematical function of the data that can be used for authentication but can't be used to reconstruct the actual biometric. Unfortunately, OPM stored copies of actual fingerprints.

Ashley Madison has taught us all the dangers of entrusting our intimate secrets to a company's computers and networks, because once that data is out there's no getting it back. All biometric data, whether it be fingerprints, retinal scans, voiceprints, or something else, has that same property. We should be skeptical of any attempts to store this data en masse, whether by governments or by corporations. We need our biometrics for authentication, and we can't afford to lose them to hackers.

Automatic Face Recognition and Surveillance

ID checks were a common response to the terrorist attacks of 9/11, but they'll soon be obsolete. You won't have to show your ID, because you'll be identified automatically. A security camera will capture your face, and it'll be matched with your name and a whole lot of other information besides. Welcome to the world of automatic facial recognition. Those who have access to databases of identified photos will have the power to identify us. Yes, it'll enable some amazing personalized services; but it'll also enable whole new levels of surveillance. The underlying technologies are being developed today, and there are currently no rules limiting their use.

Walk into a store, and the salesclerks will know your name. The store's cameras and computers will have figured out your identity, and looked you up in both their store database and a commercial marketing database they've subscribed to. They'll know your name, salary, interests, what sort of sales pitches you're most vulnerable to, and how profitable a

customer you are. Maybe they'll have read a profile based on your tweets and know what sort of mood you're in. Maybe they'll know your political affiliation or sexual identity, both predictable by your social media activity. And they're going to engage with you accordingly, perhaps by making sure you're well taken care of or possibly by trying to make you so uncomfortable that you'll leave.

Walk by a policeman, and she will know your name, address, criminal record, and with whom you routinely are seen. The potential for discrimination is enormous, especially in low-income communities where people are routinely harassed for things like unpaid parking tickets and other minor violations. And in a country where people are arrested for their political views, the use of this technology quickly turns into a nightmare scenario.

The critical technology here is computer face recognition. Traditionally it has been pretty poor, but it's slowly improving. A computer is now as good as a person. Already Google's algorithms can accurately match child and adult photos of the same person, and Facebook has an algorithm that works by recognizing hair style, body shape, and body language -- and works even when it can't see faces. And while we humans are pretty much as good at this as we're ever going to get, computers will continue to improve. Over the next years, they'll continue to get more accurate, making better matches using even worse photos.

Matching photos with names also requires a database of identified photos, and we have plenty of those too. Driver's license databases are a gold mine: all shot face forward, in good focus and even light, with accurate identity information attached to each photo. The enormous photo collections of social media and photo archiving sites are another. They contain photos of us from all sorts of angles and in all sorts of lighting conditions, and we helpfully do the identifying step for the companies by tagging ourselves and our friends. Maybe this data will appear on handheld screens. Maybe it'll be automatically displayed on computer-enhanced glasses. Imagine salesclerks -- or politicians -- being able to scan a room and instantly see wealthy customers highlighted in green, or policemen seeing people with criminal records highlighted in red.

Science fiction writers have been exploring this future in both books and movies for decades. Ads followed people from billboard to billboard in the movie Minority Report. In John Scalzi's recent novel Lock In, characters scan each other like the salesclerks I described above.

This is no longer fiction. High-tech billboards can target ads based on the gender of who's standing in front of them. In 2011, researchers at Carnegie Mellon pointed a camera at a public area on campus and were able to match live video footage with a public database of tagged photos in real time. Already government and commercial authorities have set up facial recognition systems to identify and monitor people at sporting events, music festivals, and even churches. The Dubai police are working on integrating facial recognition into Google Glass, and more US local police forces are using the technology.

Facebook, Google, Twitter, and other companies with large databases of tagged photos know how valuable their archives are. They see all kinds of services powered by their technologies -- services they can sell to businesses like the stores you walk into and the governments you might interact with.

Other companies will spring up whose business models depend on capturing our images in public and selling them to whoever has use for them. If you think this is farfetched, consider a related technology that's already far down that path: license-plate capture.

Today in the US there's a massive but invisible industry that records the movements of cars around the country. Cameras mounted on cars and tow trucks capture license places along with date/time/location information, and companies use that data to find cars that are scheduled for repossession. One company, Vigilant Solutions, claims to collect 70 million scans in the US every month. The companies that engage in this business routinely share that data with the police, giving the police a steady stream of surveillance information on innocent people that they could not legally collect on their own. And the companies are already looking for other profit streams, selling that surveillance data to anyone else who thinks they have a need for it.

This could easily happen with face recognition. Finding bail jumpers could even be the initial driving force, just as finding cars to repossess was for license plate capture.

Already the FBI has a database of 52 million faces, and describes its integration of facial recognition software with that database as "fully operational." In 2014, FBI Director James Comey told Congress that the database would not include photos of ordinary citizens, although the FBI's own documents indicate otherwise. And just last month, we learned that the FBI is looking to buy a system that will collect facial images of anyone an officer stops on the street.

In 2013, Facebook had a quarter of a trillion user photos in its database. There's currently a class-action lawsuit in Illinois alleging that the company has over a billion "face templates" of people, collected without their knowledge or consent.

Last year, the US Department of Commerce tried to prevail upon industry representatives and privacy organizations to write a voluntary code of conduct for companies using facial recognition technologies. After 16 months of negotiations, all of the consumer-focused privacy organizations pulled out of the process because industry representatives were unable to agree on any limitations on something as basic as nonconsensual facial recognition.

When we talk about surveillance, we tend to concentrate on the problems of data collection: CCTV cameras, tagged photos, purchasing habits, our writings on sites like Facebook and Twitter. We think much less about data analysis. But effective and pervasive surveillance is just as much about analysis. It's sustained by a combination of cheap and ubiquitous cameras, tagged photo databases, commercial databases of our actions that reveal our habits and personalities, and -- most of all -- fast and accurate face recognition software.

Don't expect to have access to this technology for yourself anytime soon. This is not facial recognition for all. It's just for those who can either demand or pay for access to the required technologies -- most importantly, the tagged photo databases. And while we can easily imagine how this might be misused in a totalitarian country, there are dangers in free societies as well. Without meaningful regulation, we're moving into a world where governments and corporations will be able to identify people both in real time and backwards in time, remotely and in secret, without consent or recourse.

Despite protests from industry, we need to regulate this budding industry. We need limitations on how our images can be collected without our knowledge or consent, and on how they can be used. The technologies aren't going away, and we can't uninvent these capabilities. But we can ensure that they're used ethically and responsibly, and not just as a mechanism to increase police and corporate power over us.

Resilient Systems News

Former Raytheon CEO Bill Swanson has joined our board of directors.

For those who don't know, Resilient Systems is my company. I'm the CTO, and we sell an incident-response management platform that...well...helps IR teams to manage incidents. It's a single hub that allows a team to collect data about an incident, assign and manage tasks, automate actions, integrate intelligence information, and so on. It's designed to be powerful, flexible, and intuitive -- if your HR or legal person needs to get involved, she has to be able to use it without any training. I'm

really impressed with how well it works. Incident response is all about people, and the platform makes teams more effective. This is probably the best description of what we do.

We have lots of large- and medium-sized companies as customers. They're all happy, and we continue to sell this thing at an impressive rate. Our Q3 numbers were fantastic. It's kind of scary, really.

http://fortune.com/2015/09/28/raytheon-chief-joins-resilient/

Bringing Frozen Liquids through Airport Security

Gizmodo reports that UK airport security confiscates frozen liquids:

> "He told me that it wasn't allowed so I asked under what grounds, given it is not a liquid. When he said I couldn't take it I asked if he knew that for sure or just assumed. He grabbed his supervisor and the supervisor told me that 'the government does not classify that as a solid'. I decided to leave it at that point. I expect they're probably wrong to take it from me. They'd probably not seen it before, didn't know the rules, and being a bit of an eccentric request, decided to act on the side of caution. They didn't spend the time to look it up."

As it happens, I have a comparable recent experience. Last week, I tried to bring through a small cooler containing, among other things, a bag of ice. I expected to have to dump the ice at the security checkpoint and refill it inside the airport, but the TSA official looked at it and let it through. Turns out that frozen liquids are fine. I confirmed this with TSA officials at two other airports this week.

One of the TSA officials even told me that what he was officially told is that liquid explosives don't freeze.

So there you go. The US policy is more sensible. And anyone landing in the UK from the US will have to go through security before any onward flight, so there's no chance at flouting the UK rules that way.

And while we're on the general subject, I am continually amazed by how lax the liquid rules are here in the US. Yesterday I went through airport security at SFO with an opened 5-ounce bottle of hot sauce in my carry-on. The screener flagged it; it was obvious on the x-ray. Another screener searched my bag, found it and looked at it, and then let me keep it.

And, in general, I never bother taking my liquids out of my suitcase anymore. I don't have to when I am in the PreCheck lane, but no one seems to care in the regular lane, either. It is different in the UK.

http://gizmodo.com/what-happens-if-you-take-frozen-liquids-through-airport-1729772148

According to a TSA blog post, frozen ice (not semi-melted) is allowed:
http://blog.tsa.gov/2009/11/response-to-tsa-takes-big-gulp-over.html

SHA-1 Freestart Collision

There's a new cryptanalysis result against the hash function SHA-1:

> Abstract: We present in this article a freestart collision example for SHA-1, i.e., a collision for its internal compression function. This is the first practical break of the full SHA-1, reaching all 80 out of 80 steps, while only 10 days of computation on a 64 GPU cluster were necessary to perform the attack. This work builds on a continuous series of cryptanalytic advancements on SHA-1 since the theoretical collision attack breakthrough in 2005. In particular, we extend the recent freestart collision work on reduced-round SHA-1 from CRYPTO 2015 that leverages the computational power of graphic cards and adapt it to allow the use of boomerang speed-up techniques. We also leverage the cryptanalytic techniques by Stevens from EUROCRYPT 2013 to obtain optimal attack conditions, which required further refinements for this work. Freestart collisions, like the one presented here, do not directly imply a collision for SHA-1.
>
> However, this work is an important milestone towards an actual SHA-1 collision and it further shows how graphics cards can be used very efficiently for these kind of attacks. Based on the state-of-the-art collision attack on SHA-1 by Stevens from EUROCRYPT 2013, we are able to present new projections on the computational/financial cost required by a SHA-1 collision computation. These projections are significantly lower than previously anticipated by the industry, due to the use of the more cost efficient graphics cards compared to regular CPUs. We therefore recommend the industry, in particular Internet browser vendors and Certification Authorities, to retract SHA-1 soon. We hope the industry has learned from the events surrounding the cryptanalytic breaks of MD5 and will retract SHA-1 before example signature forgeries appear in the near future. With our new cost projections in mind, we strongly and urgently recommend against a recent proposal to extend the issuance of SHA-1 certificates by a year in the CAB/forum (the vote closes on October 16 2015 after a discussion period ending on October 9).

Especially note this bit: "Freestart collisions, like the one presented here, do not directly imply a collision for SHA-1. However, this work is an important milestone towards an actual SHA-1 collision and it further shows how graphics cards can be used very efficiently for these kind of attacks." In other words: don't panic, but prepare for a future panic.

This is not that unexpected. We've long known that SHA-1 is broken, at

least theoretically. All the major browsers are planning to stop accepting SHA-1 signatures by 2017. Microsoft is retiring it on that same schedule. What's news is that our previous estimates may be too conservative.

There's a saying inside the NSA: "Attacks always get better; they never get worse." This is obviously true, but it's worth explaining why. Attacks get better for three reasons. One, Moore's Law means that computers are always getting faster, which means that any cryptanalytic attack gets faster. Two, we're forever making tweaks in existing attacks, which make them faster. (Note above: "...due to the use of the more cost efficient graphics cards compared to regular CPUs.") And three, we regularly invent new cryptanalytic attacks. The first of those is generally predictable, the second is somewhat predictable, and the third is not at all predictable.

Way back in 2004, I wrote: "It's time for us all to migrate away from SHA-1." Since then, we have developed an excellent replacement: SHA-3 has been agreed on since 2012, and just became a standard.

This new result is important right now:

> Thursday's research showing SHA1 is weaker than previously thought comes as browser developers and certificate authorities are considering a proposal that would extend the permitted issuance of the SHA1-based HTTPS certificates by 12 months, that is through the end of 2016 rather than no later than January of that year. The proposal argued that some large organizations currently find it hard to move to a more secure hashing algorithm for their digital certificates and need the additional year to make the transition.

As the paper's authors note, approving this proposal is a bad idea.

Subject: 2107 VECI labels

Hello Jim,

1) We are developing 2017 VECI labels which identify interim Tier 3 standards. Does the abbreviation used below adequately describe the interim standard in your view?

	AUDI AG VEHICLE EMISSION CONTROL INFORMATION	
Conforms to regulations:		2017 MY
U.S. EPA: IntT3B125 LDV	OBD: CA II	Fuel: Gasoline
California: ULEV II PC	OBD: CA II	Fuel: Gasoline
Adjustments needed.		DFI/AIR/2TC/CAC/2TWC/2WR-HO2S/2HO2S
Group: HVGAV04.0NUA Evap: HVGAR0155NAH		079 010 533 ?

Note – the Audi logo is misplaced in the label and I was unable to edit the drawing.

2) Can you update us on the progress of the A3 e-tron and A3 e-tron ultra Certificate of Conformity?

Regards,

Bill Rodgers

New regulatory teeth to control mobile source emissions in China

On August 29, the Chinese National People's Congress adopted the revised National Air Pollution Prevention and Control Law (new Air Law thereafter) to be effective on Jan 1, 2016. The twenty-eight year old law was last amended in 2000. The recent revision is a significant one with almost doubled number of articles compared to the 2000 version, featuring great strides in enhancing, clarifying and specifying authorities to enforce ambient air pollutants emissions standards. Specifically, the section of Motor Vehicle and Engine Emissions Control (Section 3 of Chapter 4) grows into eighteen articles (Article 50-67) from only four, and ten of them are entirely new.

This policy brief will overview some highlights in the new Air Law related to mobile source emissions control, then provides a detailed review and comparison of vehicle emissions compliance and enforcement authorities between old and new Air Law. Finally we provide high-level recommendation to China for establishing a fuller and stronger vehicle emissions compliance system with the new and clearer empowerments from the new Air Law.

Overview of new authorities in mobile source emissions control

There are several major enhancements in the new Air Law related to vehicle and engine emissions control, as summarized below. Translation of mobile source emissions related articles, and article-by-article comparison between the old and the new law are provided in the appendices.

- *Expanded regulated pollutants* to include volatile organic compounds (VOCs) and Greenhouse gases (GHGs).
- *Identified new non-road mobile sources* including off-road mobile machines and civil aircrafts.
- *Empowered new authority of emissions recall* to the National Administration of Quality Supervision, Inspection, and Quarantine (AQSIQ), and the Ministry of Environmental Protection (MEP), and also enhanced, clarified and specified authorities for other compliance and enforcement actions on road and non-road vehicles and engines at post-production (and in-use) stages.
- *Included new and clarified requirements on industry to demonstrate compliance by data reporting and disclosure* to regulatory agencies and the pubic with regard to emissions standard compliance, and emissions control maintenance technologies.

VW FOIA, EPA 06/20/2017 2017-FFP_034327

- *Included clear requirements against defeat devices and in-use tampering* of emissions control devices including on-board diagnostics systems.
- *Clarified punishment and elevated civil penalties for violation*. Empowered Ministry of Industry and Information Technology to suspend the new production of noncompliant vehicles and engines. MEP and provincial environmental agencies can impose a fine between one and three times as the market value of noncompliant products.
- *Clarified local governments' authority to implement more stringent in-use emissions testing standards* (pass/fail thresholds) than the national government.
- *Included new authority of Ministry of Communication (Transportation) to establish regional Emissions Control Area (ECA)* for shipping emissions control.

By filling holes and clarifying grey areas in the old law, the new Air Law establishes a much more comprehensive architecture and provides a more effective blueprint for enforcement of vehicle emission standards than the previous version. The new authorities will enable various compliance actions throughout vehicle/engine useful life. The following section provides detailed review and comparison of standard implementation and enforcement authorities, and existing and potential compliance actions between the old and the new Air Law.

Pre-production certification

Article 52 stipulates that motor vehicle or off-road engine manufacturers must test their newly produced vehicles and engines for emissions to make sure they meet the national standards. Only new vehicles and engines in compliance can be sold. The testing and compliance information should be published and available for public access. This new requirement may change or bring new additions to the current new model emissions type approval procedures.

Currently, before mass production and being allowed to sell a new vehicle/engine model, all vehicle/engine vehicle manufacturers must apply for Type Approval Certificates from Vehicle Emission Control Center of MEP (VECC-MEP) for their new vehicle models and engines. As part of the process, manufacturers submit vehicle prototypes to third-party testing laboratories accredited by MEP[1] for type approval testing. All of the accredited labs are partially state-owned and are often stake-held by auto manufacturers. The test labs then submit testing and type approval reports to VECC-MEP for approval and issuing the certificates if the reports suggest a pass.

In practice, all reports submitted to date are passing reports, meaning that laboratories

[1] See website of VECC for list of accredited laboratories (http://www.vecc-mep.org.cn/jcjg/index.jsp).

VW FOIA, EPA 06/20/2017 2017-FFP_034328

are not required to provide any report / data on vehicles or engines tested that do not pass the certification requirements. Therefore VECC-MEP does not receive information and data on the failed certification tests. Also this process induced fraud at the test laboratories[2] that essentially erodes the merits of MEP's type approval.

Article 52 in the new Air Law paves the way for a revised system similar to that adopted in the US, with which manufacturers may self-test their new vehicles and models, and MEP conducts confirmatory tests with targeted new models at its own test lab(s). The Article also enables early engagement of consumers in supervising emissions information released by the manufacturers.

Defeat devise

Under Chapter 7 (Legal Responsibilities), Article 109 states that provincial EPBs or MEP can impose a fine on manufacturers that produce or sell non-compliant vehicle or engine products, or adopt defeat devices or false emissions control components, and confiscate illegal income from selling such products. If violation is severe and manufacturers in question refuse to make corrections or pay the fine, MIIT can suspend the new production of noncompliant models.

Although not articulated under Chapter 4 in the new Air Law, adoption of defeat devises to bypass emissions tests and standards is prohibited in the vehicle emissions standards. For example, this is clearly written in Section 5.1.2 in the China 5 emissions standard for light-duty vehicles (China 5 standard thereafter). However, penalty for violating this requirement was neither stipulated in the old Air Law nor in the emissions standards. This omission has largely hindered potential compliance actions from MEP or EPBs to address this issue. The new Air Law made a very necessary fix.

Conformity test and inspection at production and new sales

Article 52 states that provincial EPBs and MEP shall strengthen the supervision and inspection of emissions from newly produced and sold motor vehicles and engines through on-site inspections, sample testing and other measures. Quality supervision, industrial, and commercial agencies shall support the environmental agencies in these efforts. Article 110 articulates that local industry and commercial bureaus can impose a fine on dealers that sell non-compliant vehicle and engine products. In addition, consumers have the rights to return and get refunds for if their newly purchased vehicles are not complying with relevant emissions standards.

As part of the type approval requirements in China, manufacturers need to ensure that

[2] News article exposing fraud at accredited test labs: http://finance.sina.com.cn/consume/puguangtai/20140315/092618517293.shtml

VW FOIA, EPA 06/20/2017 2017-FFP_034329

production vehicles continue to meet and conform to the approved vehicle type. It is a means of evidencing manufacturers' ability to mass-produce a series of products that exactly match the specification, performances and other requirements outlined in the type approval application. Although specific language of authority in conducting Conformity of Production tests is absent from in the old Air Law, it is part of the requirements in the vehicle emissions standards. For example, Section 7 in the China 5 standard specified procedures of COP tests by MEP. Failing the COP tests may lead to revoke of type approval certificates of the vehicles in question.

In practice, MEP's technical arm VECC conducts a number of random COP tests. Some of tests are conducted by selecting and testing vehicles right off the end of the assembly line, and some (though very rarely) are performed on vehicles obtained from the dealers. Despite occasional attempts from local EPBs to conduct random emissions inspection of new sales vehicles at dealership, there were little follow-ups (of real compliance and enforcement actions) due to lack of clear authority of enforcement.

Both Articles in the new Air Law provide clear backup to legalize and formalize such testing and investigations at production and sale stages for emissions compliance. The Articles also clarify the roles of various agencies in compliance actions, that is, the environmental agencies conduct the tests and investigations while quality supervision, industrial and commercial agencies support and enforce.

In-use compliance

There are multiple Articles touching upon various aspects of authorizes for compliance actions during vehicle in-use stage, including in-use conformity or compliance testing, anti-tampering, Inspection and Maintenance (I/M), data reporting and release, and recall.

In-use emissions conformity is part of the requirements in vehicle emissions standards. Per these standards, manufacturers must take appropriate actions to make sure their type-approved vehicles continue to meet the emissions standards during their useful life. The standards also specified detailed test procedures of in-use emissions testing and decision criteria.

For example, in China 5 standard, light-duty vehicles operated for less than 5 years (or 100 thousand km, whichever met first) must be emission tested for in-use conformity. Properly maintained in-use light-duty vehicles will be sampled and tested by accredited labs following specified testing procedures (basically same procedures as those in the type approval testing). LDV in-use testing also includes checking OBD fault codes and IUPR. The rule language for heavy-duty vehicles is relatively vague, stating all heavy-duty vehicles must demonstrate consistent in-use emissions performance as what they are certified to, but does not specify any testing procedures or methods.

VW FOIA, EPA 06/20/2017 2017-FFP_034330

There are two types of in-use emissions testing: initial tests by manufacturers and verification tests by the regulatory agency (VECC-MEP, the same agency that issues type approval certificates). In general, in-use conformity/compliance testing can be summarized in five steps: i) manufacturers test their own in-use vehicles and submit results to VECC-MEP; ii) VECC reviews and evaluates in-use testing reports; iii) based on manufacturers' reports and additional information such as feedback from I/M program or warranty, if VECC deems certain vehicles are non-compliant, it will enter further investigation procedures involving choosing vehicles for verification testing and examining and ensuring vehicles are well maintained to be used as valid test vehicles; iv) testing; and v) require manufacturers to submit remedy plans if non-compliance is confirmed.

However, much of the above only remains on paper due to the similar reason for poor COP – lack of real authority to enforce. So far VECC-MEP has not really conducted any in-use conformity/compliance testing at the national level, though Beijing EPB had implemented routine in-use tests since 2006[3].

Therefore, again, the more definite and enhanced non-compliance penalties in Article 109-110 will provide tangible and strong back up for regulatory agencies to implement the above in-use compliance actions. In addition, Article 53 states that local EPBs (township level and above) may conduct random on-site in-use emissions inspection and testing at parking facilities, repair shops, and at roadside (using remote sensing and other technologies). Public security authorities shall support these efforts. The concept of on-site random testing was raised in the old Air Law too. The new Air Law expanded the spectrum of testing methods/approaches that enable regulatory agencies to conduct more accurate and frequent testing, and also specified the roles of various agencies.

Penalties

Stage	Existing Authority/compliance actions	New Authority/potential compliance actions
Pre-production	MEP issues Type approval certificates: certified third-party test labs conduct tests. Reports	• Traditional type approval; or • OEM self-test, then submit and publish test results to MEP and the public. MEP only conducts

[3] http://www.bjepb.gov.cn/bjepb/413526/413560/413590/414960/438934/index.html, and http://www.bjepb.gov.cn/bjepb/413526/413560/413590/414960/425630/index.html

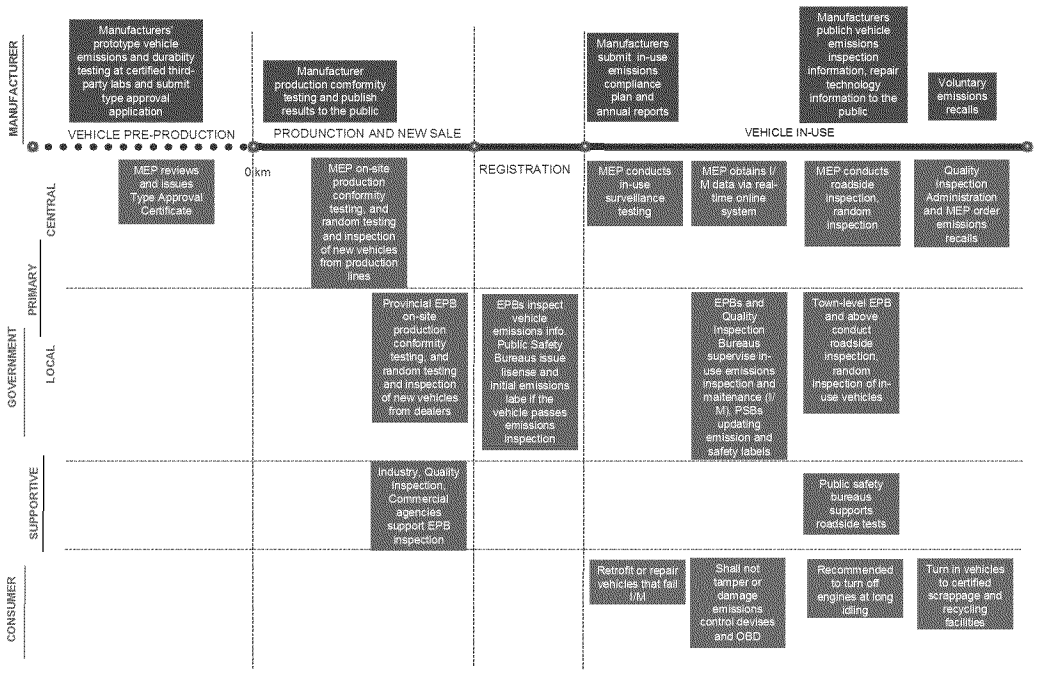
VW FOIA, EPA 06/20/2017 2017-FFP_034331

		submit to MEP for type approval.	
Production/Sale		No clear authority in the Law, but in the emission standards, MEP may conduct Conformity of Production (at assembly lines)	Clear authorizes of • MEP conducting COP tests over vehicles/engines sampled from production line or from dealership • Provincial EPB conducting random inspection/tests at dealership
Registration		No clear authority	• EPB physical inspection of emissions control devises, report to MEP
In-use	Testing	No clear authority in the Law, but in the emission standards, there is vague requirement of all new vehicles must meet emissions standards throughout useful life	Clear authorizes of • MEP conducting in-use testing, and/or roadside inspection and testing • Local EPBs conducting on-site, roadside inspections and remote sensing tests
	Anti-tampering	None	• Local EPBs and above impose a fine to vehicle owners for tampering emissions control or OBD systems
	I/M	Local EPBs or transportation bureaus supervise I/M facilities	• Local EPBs and Quality Accreditation bureaus supervise I/M facilities
	Recall	None	• Quality Inspection Administration and MEP jointly conduct emissions recalls
	Data	None	• Provincial transportation bureaus and MOT require OEM and importers to publish repair information • I/M stations must provide real-time data to EPBs and MEP
Penalty at all stages		MEP and provincial EPBs impose small fine on OEMs producing (importing) non-compliant vehicles	• MEP and provincial EPBs impose large fine on OEMs producing non-compliant vehicles and adopting defeat devices, and destroy noncompliant vehicles • MIIT revokes production certificate if no correction of above issues • Local commercial bureaus and Customs impose large fine on importers and dealers selling noncompliant vehicles • Provincial EPB and MEP impose a fine on OEMs or importers not publishing required emissions data

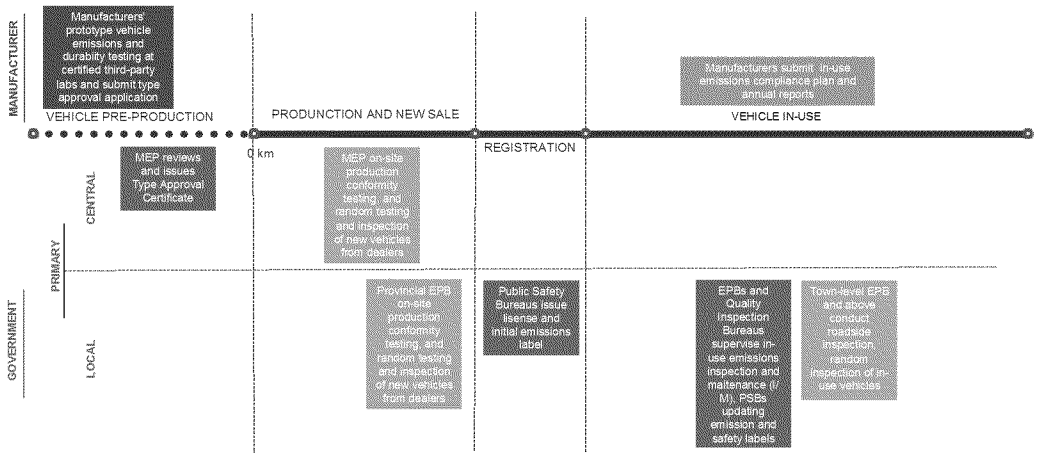
VW FOIA, EPA 06/20/2017 2017-FFP_034332

		Provincial transportation bureaus and MOT impose a fine on OEMs and importers not publishing required repair data

Table x summarizes the comparison of the above authorizes, and Figure x visualizes the various potential compliance actions authorized by the new Air Law on a timescale representing vehicle useful life.



Authorities and potential compliance actions under the New Air Law



Authorities and compliance actions under the old Air Law

Recommendations

Appendix A. Translation of mobile source emission control articles in the new Air Law

Chapter I General Provisions

Article 2 General principles of air pollution prevention shall include: the goal of improving atmospheric environmental air quality, focusing on controlling emissions at their sources with reasonable planning ahead, transforming economic development path, optimizing industrial structure and layout, and adjusting energy structures.

The law comprehensively addresses the prevention and control of air pollution from coal, industries, motor vehicles and vessels, fugitive dust, agriculture as well as other pollution sources; promotes joint regional air pollution prevention and control, co-efforts to reduce air pollutants including particulate matter, sulfur dioxide, nitrogen oxide, volatile organic compounds, ammonia and greenhouse gases.

Chapter IV Air Pollution Prevention and Control Measures

Section 3 Prevention and control of air pollution from motor vehicles, vessels and other non-road mobile sources

Article 50 The state promotes low-carbon and environmentally friendly travel, controlling the number of motor vehicles based on city planning, developing an urban public transport system and promoting public transportation.

The state promotes energy-saving and new-energy motor vehicles, vessels and non-road mobile machinery, restricts the development of highly polluting and energy consumptive motor vehicles, vessels and non-road mobile machinery, and reduces fossil fuel consumption through financial, taxation incentives and government procurement.

Provincial, municipal and local governments, if conditions permit in their governed regions, may implement the national motor vehicle emissions standards ahead of the national schedule. If so, the relevant local governments should report to the environmental department of the State Council for recordkeeping.

Municipal governments shall strengthen and improve urban traffic management, optimize transportation planning, and ensure smooth traffic flow on pedestrian sidewalks and non-motor vehicle lanes.

Article 51 Pollutants emitted from motor vehicles, vessels and non-road mobile machinery shall not exceed stipulated emissions standards.

It is prohibited to produce, import or sell motor vehicles, vessels and non-road mobile machinery not in compliance with stipulated emissions standards.

Article 52 Manufacturers of motor vehicles and non-road mobile machinery shall conduct emissions testing of their newly produced motor vehicles and non-road mobile machinery for compliance. Only new vehicles and machines in compliance can be sold. The testing information should be published and available for public access.

The competent environmental protection agencies of provincial governments and above shall strengthen the supervision and inspection of emissions from newly produced and sold motor vehicles and non-road mobile machinery through on-site inspections, sample testing and other measures. Other governmental agencies such as quality supervision, industrial and commercial administrations shall support the environmental agencies in these efforts.

Article 53 In-use motor vehicles must be regularly inspected by motor vehicle emission testing institutions for exhaust emissions according to relevant national or local regulations. Only vehicles passing such in-use emissions inspections are to be permitted to operate on roads. For those failing to pass the test, the traffic administrative department of public security bureaus shall not issue them required safety technical inspection labels. The competent environmental protection administration of local governments at town level or above may supervise and conduct random emissions tests of in-use motor vehicles in parking lots or repair shops［旧三十五条］. Without interrupting the traffic, the relevant government agencies may use remote sensing and/or other technologies to randomly test and supervise emissions from in-use motor vehicles. Relevant traffic administrative

departments of public security bureaus shall support these efforts.

Article 54 Motor vehicle emissions inspection institutions must be certified and use official testing equipment to test emissions from motor vehicles, following test protocols set by the competent department of environmental protection administration under the State Council. Test results shall be shared with the competent environmental protection department online and in real-time. Motor vehicle emissions testing institutions and their legal representatives (managers) are responsible for the authenticity and accuracy of the test data.

The competent environmental protection departments, as well as certification and accreditation administration departments, shall supervise and inspect the emissions testing carried out at testing facilities.

Article 55 Manufacturers and importers of motor vehicles shall release information on vehicle emissions testing results, emission control and repair technologies of their vehicles to the public.

Motor vehicle repair shops shall repair in-use motor vehicles according to air pollution prevention and control requirements and relevant national technological protocols, and make the vehicles meet required emissions standards［旧三十三条］. Competent transportation departments and environmental protection departments shall strengthen their supervision and management according to the law.

Motor vehicle owners are prohibited to tamper with the emissions tests, such as by temporarily changing exhaust pollution control devices on their motor vehicles to pass vehicle emission tests. Motor vehicle repair facilities are forbidden to provide such fraud repair services to motor vehicle owners. It is forbidden to damage vehicle on-board diagnostic systems.

Article 56 The competent department of environmental protection administration, together with other relevant departments of transportation, housing, urban-rural development, agriculture administration and water administration, shall supervise and inspect air pollutant emissions of non-road mobile machinery. If emissions exceed standards, the machinery shall not be used.

Article 57 The state promotes environment-friendly travels, and encourages drivers of vehicles burning fossil fuel to turn off their vehicle engines when idling for three or more minutes to reduce emissions.

Article 58 The state shall establish an environmental recall system for motor vehicles and non-road mobile machinery.

After being informed of emissions noncompliance by regulatory agencies, manufacturers and importers of motor vehicles and non-road mobile machinery must recall their affected products if the noncompliance is proven to have design or production defects or if they fail the durability requirements in relevant emission standards. If the manufacturers or importers do not recall their affected products, the department of quality supervision under the State Council will collaborate with the competent department of environmental protection administration under the State Council to order the companies in question to issue a recall.

Article 59 In-use heavy duty diesel vehicles and non-road mobile machinery without emission control devices, or with inadequate devices that do not conform to relevant emissions requirements, shall have one installed or replaced with an appropriate pollution

control device.

Article 60 In-use motor vehicles that do not comply with relevant emissions standards shall be repaired. Vehicles that still fail to meet emissions standards after repairing and applying appropriate emissions control technologies must be scrapped. Vehicle owners shall send or sell their vehicles to vehicle scrap page and recycling facilities, which shall record, dismantle, and destroy the vehicles according to relevant national requirements.

The state encourages and supports the early retirement of high-emission motor vehicles, vessels and non-road mobile machinery.

Article 61 City-level governments may, depending on local air quality, designate and declare areas where the use of highly polluting non-road mobile machinery is prohibited.

Article 62 Engines and emissions related equipment on vessels must be inspected by official vessel testing and inspection institutions. Only vessels that pass the test and conform to relevant emissions standards can be operated.

Article 63 Inland ships and sea-river vessels shall use general diesel fuels according to the national standards. After reaching a port, ocean-going vessels shall use marine fuel that meets pollutant control requirements.

Ports shall plan, design, and construct an on-shore power infrastructure at newly-built docks, and gradually upgrade existing docks with on-shore power infrastructure. Vessels shall use on-shore power upon reaching ports if the option is available.

Article 64 The competent transportation department of the State Council may designate atmospheric pollutant emissions control areas in coastal regions, and vessels traveling in the certain areas must meet the relevant vessel emission standards.

Article 65 It is prohibited to produce, import and sell fuels for motor vehicles, vessels and non-road mobile machinery that fail to meet relevant standards［旧三十四条］; it is prohibited to sell general diesel fuel or other non-motor fuel to motor vehicle and motorcycle owners (for the fuel to be used on these vehicles); and it is prohibited to sell residual oil and heavy oil to non-road mobile machinery, inland ships and sea-river vessels.

Article 66 Hazardous substances in engine oil, nitrogen oxide reducing agents, additives for fuels, lubricants, other additives, and other specifications shall meet relevant standards. These substances shall not reduce the effectiveness and durability of pollution control devices on vehicles and vessels, nor increase emissions of any new ambient air quality pollutant.

Article 67 The state promotes pollution control of civil aircrafts and encourages effective measures to reduce air pollutant emissions during the design, production and use of civil aircrafts.

VW FOIA, EPA 06/20/2017 2017-FFP_034337

Chapter V Joint Air Pollution Prevention and Control in Key Regions

Article 88 The competent department of economic affairs under the State Council and competent department of environmental protection administration under the State Council, jointly push for more stringent requirements for environment protection, energy consumption, safety and quality in the key regions, based on local industrial development status and ambient air quality conditions.

Local governments of provinces, autonomous regions and municipalities in the key regions shall adopt more stringent vehicle ambient air emissions standards, standardize in-use vehicle emissions inspection test methods and limits, and adopt qualified matching motor fuel.

Chapter VII Legal Liabilities

Article 103 If any entity or individual commits any of the following acts in violation of the Law, the qualified supervision, industry and commerce administration departments of town-level local governments or above shall require the entity or individual to make corrections, confiscate raw materials, products and illegal income, and impose a fine on the entity or individual for more than one time, but less than three times of the value of goods:

(1) Selling coal and petroleum coke that cannot meet quality standards;

(2) Producing or selling raw materials and products with VOC content that fails to meet quality standards or requirements;

(3) Producing and selling the fuel of motor vehicles, vessels and non-road mobile machines, engine oil, nitrogen oxide reducing agents, fuel and lubricant additives, and other additives that fail to meet quality standards;

(4) Selling high pollution fuels in forbidden areas that prohibit the act of burning substances.

Article 104 If any entity or individual commits any of the following acts in violation of the Law, the entry-exit inspection and quarantine institutions shall require the entity or individual to make corrections, confiscate raw materials, products and illegal income, and fine the entity or individual more than one time, but less than three times of the value of goods; if the importing act can be defined as smuggling, the entity shall be punished by Customs:

(1) Importing coals or petroleum coke that cannot meet quality standards;

(2) Importing raw materials and products with VOC content that cannot meet quality standards or requirements;

(3) Importing fuel oil used by motor vehicles, vessels and non-road mobile machines, engine oil, nitrogen oxides reducing agents, fuel and lubricant additives, and other additives that cannot meet quality standards.

Article 106 If any entity or individual, in violation of the Law, uses marine fuel oil that cannot meet quality standards, the maritime administration agency and the competent department of fisheries shall impose a fine on the entity or individual for more than RMB10,000, but less than RMB100,000.

Article 109 If any entity or individual, in violation of the Law, manufactures any vehicle or non-road mobile machinery that fails to meet pollutant emission standards, the competent environmental protection administration of local governments at or above province level shall require the entity or individual to

make corrections, confiscate their illegal income, impose a fine on the violating entity or individual for more than one time, but less than three times of the value of goods, and confiscate and destroy the noncompliant motor vehicles and non-road mobile machinery. If the above actions are denied by the manufacturer, the competent motor vehicles industry department of the State Council shall suspend the production of the affected vehicle models.

If the manufacturers of motor vehicles and non-road mobile machinery in violation of the Law sell new vehicles or machines with low-quality or false emissions control devises that are different from those equipped on certified vehicle or engine models and cannot meet relevant emissions standards, the competent environmental protection administration of local governments at or above the province level shall require the suspension of the production plants for rectification, confiscate the companies' illegal income, impose a fine on the violating entities or individuals for more than one time, but less than three times of the value of goods, and confiscate and destroy the noncompliant motor vehicles and non-road mobile machinery. The competent motor vehicles production department of the State Council shall suspend the production of motor vehicle and engine models in question.

Article 110 If any entity or individual, in violation of the Law, imports or sells any vehicle or non-road mobile machinery that fails to meet pollutant emission standards, the industrial and commercial administrative departments and the entry-exit inspection and quarantine institutions of the governments at or above the county level shall confiscate their illegal income, impose a fine on the violating entities or individuals for more than one time, but less than three times of the value of related goods; and confiscate and destroy the noncompliant vehicle of non-road mobile machinery. If the importing act can be defined as smuggling, the entity shall be punished by Customs.

If any vehicle or non-road mobile machinery sold fails to meet pollutant emission standards, the seller shall be responsible for repairing, replacing or accepting the return of goods; if any losses are incurred to the consumer buying the vehicle, the seller shall compensate for the losses.

Article 111 If manufacturers or importers of motor vehicles, in violation of the Law, fail to release to the public information about their vehicles' emissions test or emissions control technologies, the competent environmental protection administration of local governments at or above province level shall require the violating entities or individuals to make corrections and impose fines of more than RMB 50,000, but less than RMB 500,000.

If manufacturers or importers of motor vehicles, in violation of the Law, fail to release relevant information about emissions repair and maintenance technologies to the public, the competent environmental protection administration of local governments at or above the province level shall order the entity or individual to make corrections and impose fines of more than RMB 50,000, but less than RMB 500,000.

VW FOIA, EPA 06/20/2017 2017-FFP_034341

Article 112 If any vehicle testing and supervision institution, in violation of the Law, forge an emission test result or issue a fake emission test report for vehicles or any non-road mobile machinery, the competent environmental protection administration of local government at or above the county level shall confiscate illegal incomes and impose fines of more than RMB 100,000, but less than RMB 500,000; in serious cases, the department in charge of accreditation shall revoke the testing qualifications of the institution.

Entities that forge the emission test results or issue the fake emission test reports of vessels shall be punished by the maritime administrative department according to the Law.

If any entity uses fraudulent methods such as temporarily replacing vehicle exhaust pollution control devices to pass vehicle emission tests, or destroying motor vehicle emission on-board diagnostic systems, the competent environmental protection administration of local government at or above the county level shall fine the owner 5,000 RMB, and fine the vehicle maintenance entity RMB 5,000 per motor vehicle.

Article 113 Drivers who operate motor vehicles that fail to pass emission tests on the road in violation of the Law, shall be punished by the traffic administrative department of the public security organ according to the Law.

Article 114 If any entity or individual, in violation of the Law, uses non-road mobile machinery that fails to meet emission standards and requirements, or uses heavy diesel vehicle and non-road mobilemachinery without installing and replacing pollution control devices, the competent environmental protection administration of local government at or above the county level shall order the entity to make corrections and impose fines of RMB 5,000.

Those who use high emission non-road mobile machinery in forbidden areas shall be punished by the competent environmental protection administration of local government according to the Law.

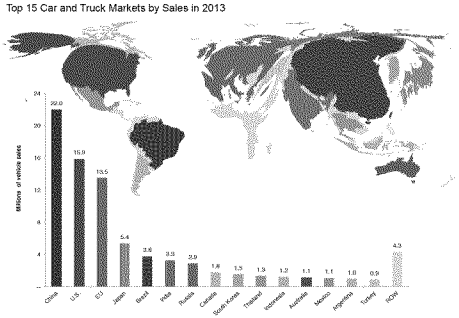
ICCT mission and activities
ICCT目标和简介

The mission of ICCT is to dramatically improve the environmental performance and efficiency of cars, trucks, buses and transportation systems in order to protect and improve public health, the environment, and quality of life.

国际清洁交通委员会(ICCT)宗旨是改善包括轻、重型车车、航空和船舶等所有交通部门及整个交通系统的能效和环境影响，从而促进人类健康。

- Non-profit research organization
- Air Pollution and Climate Impacts
- Focus on regulatory policies and fiscal incentives
- Activity across modes including aviation and marine
- Global outreach, with special focus on largest markets

- 非盈利独立研究组织
- 着眼于空气污染和气候变化影响
- 研究主要针对标准法规政策策、辅助性政策
- 研究方向覆盖所有交通部门
- 项目涉及全球主要汽车市场场、全球性视角



icct
THE INTERNATIONAL COUNCIL ON CLEAN TRANSPORTATION

Timeline of Volkswagen Defeat Device Investigation and Discovery

- **2012** – ICCT's European office concerned with elevated real world NOx emissions from passenger diesels in Europe.
- **2013** – ICCT contracts with West Virginia University to conduct real world emissions testing on three passenger diesel vehicles in California. CARB provides in-kind support via its test center in El Monte.
- **May 2014** – ICCT publishes its findings which show two of the three cars with 5 – 35X times the legal limit under normal driving conditions. We inform EPA, CARB, and VW.
- **December 2014** – VW agrees to a voluntary recall of passenger diesels.
- **May 2015** – CARB retests recalled vehicles and finds some improvement, but not enough.
- **July-September 2015** – US EPA informs VW that it will not be granted license to sell 2016 vehicles in the US if the Agency's questions are not addressed fully. VW admits to defeat devices on September 3, 2015.
- **September 18, 2015** – US EPA, DOJ, and CARB announce a notice of violation against VW for using illegal defeat devices.
- **September 22, 2015** – VW announces that 11 million diesel cars worldwide have the same "defeat device" software.
- **September 25, 2015** – US EPA and CARB issue updated requirements related to evaluation of defeat devices

大众失效装置调查和发现的时间轴

- **2012** – ICCT 的欧洲办事处关注欧洲乘用车实际的高 NOx 排放
- **2013** – ICCT 与西弗吉尼亚大学签订合同，在加州对三辆乘用柴油车进行现实世界排放测试。CARB 通过他们在 El Monte 的实验室提供实物支持。
- **5月 2014** – ICCT 公布了调查结果，显示三辆车中有两辆在正常驾驶条件下排放是法定上限的5 – 35X 倍。我们通知了EPA, CARB, 和 VW。
- **12月 2014** – VW 同意自愿召回乘用柴油车。
- **5月 2015** – CARB 重新检测召回的车辆并发现了一些改进，但并不足够。
- **7-9月 2015** – US EPA 通知 VW，如果他们不充分回答问题，EPA 将不会给他们颁发销售2016年汽车所必需的认证证书。VW 在2015年9月3日承认了失效装置的存在。
- **9月 18日, 2015** – US EPA, DOJ 和 CARB发表了对于VW使用违法失效装置的通知知。
- **9月 22日, 2015** – VW

ICCT's position brief on reducing real-world driving emissions

ICCT 对于减少实际排放的建议

VW scandal is an opportunity to act fast, close the "real-world gap" using **readily available policy elements**:

- **Accelerated (2017) adoption of WLTP by NEDC regions:** Better cycle + robust procedure = more realistic results in the short term
- **Defeat device screening programs:** CARB and EPA's program a useful template for other world regions. EU member states urged to start screening immediately
- **In-use compliance programs:** Real world testing programs can be built on the basis of the European RDE experience, but using vehicles sourced from the real market (no more "golden cars"), and expanding the testing conditions to cover a wide range of operating conditions

- 大众事件是一个采取迅速行动动，利用**现成政策要素**减少"现实差距"的机会：
- **加速（2017）NEDC地区采用WLTP的进程程：更好的周期 + 可信的程序 = 短期内更多实际成果**
- **失效装置筛选：**CARB 和 EPA 的项目给世界其他地区提供了有用的模版。敦促欧盟成员国立即开始筛选。
- **在用车辆达标管理：**现实测试可以基于欧洲的RDE经验，但车辆需从市场获得（不再用"理想车辆"），并且扩大测试条件以涵盖不同的运行状况

Dear Mrs. Kaul,

with best wishes from our CEO Jürgen Resch, please find attached a letter we (Environmental Action Germany, DUH) sent to CEOs of German car industry and asked them several questions, among them which defeat devices they use and under what conditions they work.

Please also find attached the answer letter from the CEOs (in german).

Kind regards

Berlin, 21 September 2015

Your company's statement regarding the use of defeat devices in new Euro 5 and Euro 6 diesel or gasoline direct injection vehicles of all of your company's brands

Deadline for comments: Friday, 25 September 2015 – to be re ceived by us by 3 p.m.

Dear Mr Stadler,

Since 13 October 2004, the Deutsche Umwelthilfe e.V., (German Environmental Aid Association, DUH), Fritz-Reichle-Ring 4, 78315 Radolfzell, has been registered in the list of qualified entities under § 4 of the Act on Applications for an Injunction, effective as of 11 October 2004.

The DUH is, therefore, able to prevent violations of the law against unfair competition and other consumer protection laws by taking appropriate measures of collective redress. For years, it has concerned itself with – as you know – the reduction of toxic emissions from combustion and, in this case in particular, diesel engines.

Within the framework of our education campaign "Diesel exhaust fumes kill" initiated in Frankfurt last Thursday – at the same time as the o pening of the IAA by Dr Merkel – we have referred to our own measurements as well as to investigations of the ICCT and our European umbrella association T&E. According to the investigations that you are also familiar with, in real operation Euro 6 diesel cars demonstrate similarly extremely elevated NOx/NO2 values as those involved in the current investigations of the CalEPA and the EPA in Washington concerning VW and Audi models (cf. indictment sent to VW and Audi on 18 September 2015).

Deutsche Umwelthilfe e.V.
Bundesgeschäftsführer: Jürgen Resch, Sascha Müller-Kraenner

Die Deutsche Umwelthilfe e.V. ist als gemeinnützig anerkannt. Die Jahresabschlüsse unterliegen der freiwilligen Kontrolle durch ein unabhängiges Wirtschaftsprüfungsunternehmen.

Article 5 of Regulation (EC) No. 715/2007 states:

Requirements and tests

(1) The manufacturer shall equip vehicles so that the components likely to affect emissions are designed, constructed and assembled so as to enable the vehicle, in normal use, to comply with this Regulation and its implementing measures.
(2) The use of defeat devices that reduce the effectiveness of emission control systems shall be prohibited.

The DUH is in possession of indications that the vehicles of your company obviously also exhibit NO_2 values that are many times higher than expected and which cannot be explained by normal variations between the test roll and on-road operation and which point to the presence of "test cycle recognition" and/or defeat devices or, under certain operating conditions, do not function correctly.

I urge you to answer the following questions Friday, 25 September 2015, submitting them to us no later than by 3 p.m. They relate to all the brands you are responsible for and all their models of Euro 5 and Euro 6 stages of all fuels (esp. diesel engines and gasoline direct injection engines):

1. Which models recognise test situations via the f actory-provided operating software and then change the impact of the emission reduction device and switch to another map with increased emission values? Please explain in brief the nature and intensity.
2. What are the parameters that cause these vehicle s to recognise the test situation? (E.g. ambient temperature > 30 degrees, accelerometer, steering wheel position, velocity pattern of the test cycles on file etc.)
3. Is the supply of keratin in vehicles with SCR sy stems above or below a certain ambient temperature – except during a cold start – ge nerally or in combination with other parameters inhibited or throttled?
4. Which diesel models that have SCR that are appro ved for the European market switch off urea injection at speeds above 120 km/h (or higher/lower) (please quote the velocity as of which the respective model throttles or stops the injection of urea)
5. In the event that, with diesel models equipped w ith SCR, the urea tank drops below a minimum level:
   - do the OBD always automatically point out to the driver in good time that he needs to fill the tank up or is no notification given?
   - does this lead (with an empty or nearly empty tank) to the statutory emergency operation or does the operating software just regulate the urea injection in the SCR system without any error message in the OBD?

VW FOIA, EPA 06/20/2017 2017-FFP_034368

Deutsche Umwelthilfe

6. Please inform us of the results of the RDE value s for Euro 6 diesel cars models that you currently have at hand.
7. With respect to the measurement of fuel consumpt ion and CO2 emissions, which car models have the operating software that recognises the test mode?

We wish to remind you that the DUH intends to undertake selective measurements on the production vehicles already on the market in order to verify your details. We will take legal action in response to any wrong answers or non-responses (which we regard as on a par with wrong answers) and also inform the public and the supervisory authorities.

In this respect, we call on you to provide a full statement by the due date and time. The dramatic damage to the credibility of Volkswagen AG as a result the continuous misinformation of American government agencies by Volkswagen and Audi that went on for over a year is a cautionary example.

Yours sincerely,

Jürgen Resch

Federal Chairman

Dear Mrs. Kaul,

with best wishes from our CEO Jürgen Resch, please find attached a letter we (Environmental Action Germany, DUH) sent to CEOs of German car industry and asked them several questions, among them which defeat devices they use and under what conditions they work.

Please also find attached the answer letter from the CEOs (in german).

Kind regards

Your company's statement regarding the use of defeat devices in new Euro 5 and Euro 6 diesel or gasoline direct injection vehicles of all of your company's brands

Deadline for comments: Friday, 25 September 2015 – to be re ceived by us by 3 p.m.

Dear Mr Stadler,

Since 13 October 2004, the Deutsche Umwelthilfe e.V., (German Environmental Aid Association, DUH), Fritz-Reichle-Ring 4, 78315 Radolfzell, has been registered in the list of qualified entities under § 4 of the Act on Applications for an Injunction, effective as of 11 October 2004.

The DUH is, therefore, able to prevent violations of the law against unfair competition and other consumer protection laws by taking appropriate measures of collective redress. For years, it has concerned itself with – as you know – the reduction of toxic emissions from combustion and, in this case in particular, diesel engines.

Within the framework of our education campaign "Diesel exhaust fumes kill" initiated in Frankfurt last Thursday – at the same time as the o pening of the IAA by Dr Merkel – we have referred to our own measurements as well as to investigations of the ICCT and our European umbrella association T&E. According to the investigations that you are also familiar with, in real operation Euro 6 diesel cars demonstrate similarly extremely elevated NOx/NO2 values as those involved in the current investigations of the CalEPA and the EPA in Washington concerning VW and Audi models (cf. indictment sent to VW and Audi on 18 September 2015).

Deutsche Umwelthilfe e.V.

http://www.nytimes.com/2015/10/19/business/the-owner-has-a-crucial-part-in-volkswagen-diesel-repair.html?_r=0

Essential Part of the Volkswagen Diesel Repair Is the Owner

By CHRISTOPHER JENSEN OCT. 18, 2015

Even as Volkswagen embarks on the task of fixing the emissions systems it disabled on almost 500,000 of its diesel vehicles in the United States, the automaker faces another hurdle: persuading owners to make the repair at all.

That's because the software that allowed Volkswagen to fool federal emissions tests also lowered the car's performance and fuel economy while the device was turned on. So for owners, the prospect of having a car's emissions cleaned up, only to have the car perform worse — whatever the pollution — is not sitting well.

"If we take a 10 percent hit in our gas mileage, I can live with that, but I won't be happy," said Patrick Downs, who lives in Port Angeles, Wash., and owns a 2013 Jetta TDI.

"If it is 25 percent or more and the performance is degraded to the point where the car has a lot less torque and pickup, that is going to make me very unhappy," he added. "That is going to make me consider not getting the fix."

It was well known among owners of Volkswagen diesels that the cars' advertised fuel economy — as shown on the window sticker — was almost always lower than their real-world performance.

Volkswagen could have saved fuel or improved performance by allowing more pollutants to pass through its cars' exhaust systems, researchers said.

Michael Horn, head of Volkswagen's American unit, told a congressional panel this month that the repairs he outlined — which will take years and require significant new equipment — might result in a slightly lower top speed in the cars. But he was careful to say that the cars' fuel economy would not be lower than the rating on the window sticker.

That's not satisfactory, said Jeff Hinton, the owner of a 2013 Passat diesel. "Every TDI owner will tell you, 'I get much better numbers, miles to the gallon, than any number that is on that Monroney sticker,'" Mr. Hinton, 36, said in a telephone interview from Morrisville, N.C., using a term for the window sticker.

"On recent trips, 500 miles plus, I've gotten 52 to 55 miles per gallon," Mr. Hinton said. The Environmental Protection Agency rating on the window sticker of his Passat is 40 miles per gallon on the highway.

"I wouldn't want my car recalled or reprogrammed or retrofitted in any way if it is going to hurt the performance, because that is not what I paid for," he said.

The E.P.A. cannot force owners to repair their vehicles, said Julia Ortiz, a spokeswoman for the agency.

Automakers also cannot require owners to carry out the emissions recall, just as they cannot force owners to take vehicles in to complete a safety recall.

Some states require vehicles to pass emissions tests before they can be registered each year. But those tests are far less sophisticated than the E.P.A.'s, and the Volkswagens that are not repaired are sure to pass them, said John German, a senior fellow at the International Council on Clean Transportation, which played a crucial role in discovering the automaker's deceit.

That loophole means the air pollution consequences of Volkswagen's action — at least on a small scale — are irreparable if enough owners refuse to have their vehicles fixed.

Despite their small size, the Volkswagen diesels produce a large amount of nitrogen oxide pollutants, Mr. German said, up to 40 times what is allowed under the Clean Air Act. The Passat sedan is emitting an amount of nitrogen oxides similar to that of a modern, medium-duty truck, he said, while the Jetta — and its sibling the Golf — have emissions similar to those of a typical modern 18-wheeler, he said. The Jetta and Golf use a different emissions system than the Passat.

Volkswagen must come up with an incentive plan to make repairing the engines irresistible, said Dan Becker, the director of the Safe Climate Campaign at the Center for Auto Safety.

"Volkswagen made this disaster; it is its responsibility to fix it," he said in a telephone interview. "We need to recognize that consumers may need to have an incentive to do what the law requires."

General Motors, for example, last year offered $25 gift cards to owners of about 2.6 million older small cars that could have defective ignition switches. But unlike the case with the Volkswagens, that was for a potentially fatal defect that has been linked to at least 124 deaths.

The average completion rate of repairs on recalled vehicles in the United States is 75 percent over 18 months, according to the National Highway Traffic Safety Administration.

Some states try to address the issue of owners who do not comply with air pollution recalls.

New Jersey has a law requiring owners to have emissions recalls carried out on their vehicles and to provide proof in order to register them. But it has never been used and it would be "premature and speculative" to discuss how that law might apply to Volkswagen, said Mairin Bellack, a spokeswoman for the state's Motor Vehicle Commission.

California also requires owners to have their vehicles repaired, said Stanley Young, a spokesman for the California Air Resources Board. The automaker has until Nov. 20 to submit a remedy to California regulators, which must then be approved.

"If it turns out that there is not enough of a response, we do have in California the option of putting a block on registration until the fix is done," he said. "But that is only as a last resort."

Even before Volkswagen announced the recall remedy, diesel owners fretted about the impact.

"Do not take your car to the dealer for service (if it's out of warranty) as they will automatically install the eventual software fix if you do," an owner wrote on the Volkswagen Owners Club website. "This software fix will allow the car to pass emissions, but it will lower MPG, decrease performance and finally reduce component life of the engine and emissions system."

But some emissions experts say it's hard to predict the consequences, since it is not clear exactly what Volkswagen did.

Federal regulators have said the automaker installed software that signaled the emissions system to work during the E.P.A. tests, but then at least partly disabled it during routine driving.

Even the motivation is unclear.

"Fuel economy could be a factor but it need not be the factor," said Arvind Thiruvengadam, research professor at West Virginia University, which helped uncover VW's cheating. "Meeting lower emissions means it is also a lot of burden on other components of the vehicle."

Part of the strategy, then, could have been to minimize mechanical wear and tear, he said.

Mr. German at the International Council on Clean Transportation said that what all this meant to diesel owners would not be clear until Volkswagen provided far more information.

He said there might be a loss in fuel economy, although he would be surprised if it was significant. "It shouldn't be, like eight miles per gallon or anything like that," he said.

Consumer Reports tested two Volkswagen diesels, with and without the cheating software activated. In one of the cases, a 2015 Jetta TDI got 53 m.p.g. without the modification used to cheat, compared with 50 m.p.g. with it. The advertised fuel economy was 45 miles per gallon.

Mr. German said he would be surprised if the smooth delivery of power without hesitation or surges was a major problem because vehicles today have advanced fuel-injection systems and sophisticated computers.

"It is rare for there to be a drivability problem," he said. "You can almost always figure out some way to manage it."

That leaves owners like Mr. Downs in Washington State, who is waiting to see how his Jetta diesel will be affected and what to do about the recall. But he readily acknowledges he is pondering the environmental downside of not repairing the car.

"What does this mean in terms of actual environmental impact?" he said. "It is millions of cars. That weighs heavy on my mind."

VW commercials getting a new view in light of emissions scam

Oct 19 2015

"Diesel in Latin means 'soiled, '" chimes in one other pal within the backseat.

"See how clear it's!" she exclaims, holding up the spotless scarf.

When asked by the House of Representatives' Energy and Commerce Committee' s Oversight and Investigation subcommittee recently, instead of coming clean, Volkswagen US CEO Michael Horn just chose to blame it on the software engineers. The device converts smog-triggering nitrogen oxide into harmless oxygen and nitrogen gases.

For years, the company aired memorable TV spots using terms such as *miraculous* to describe the car*s seemingly too-good-to-be-true balance of peppy acceleration, 40-mile-per-gallon gas mileage and low greenhouse gas emissions. While the FTC can't send anyone to jail, it has authority to protect consumers and impose wide-ranging penalties.

"That a separate device was included in the redesigned 2016 cars could suggest a multi-year effort by the company to influence USA emissions tests that continued even after regulators began pressing the company last year about irregularities with the emissions produced by the older cars".

VW is now working with regulators to continue the certification process needed to sell its 2016 diesel cars. Those could potentially include paying cash restitution to the affected vehicle owners and forcing VW to buy new national ads admitting the company lied to its customers. If you

would like to discuss another topic, look for a relevant article.

The ads have additionally been faraway from the corporate's web sites and YouTube channel. Jeannine Minivan, the spokesperson from Volkswagen, confirmed that the 2016 models feature new software dubbed "auxiliary emissions control device" and this information was disclosed to the California and US EPA regulators last week.

VW is now coordinating with the Environmental Protection Agency on an anticipated recall of the nearly 500,000 bought within the D.R. because the suspect software program first appeared in its 2009 diesel fashions. Owners can key of their auto identification quantity stamped on the dashboard close to the driving force's windshield.

A month into VW scandal, no sales meltdown

Dealers reporting mixed results

Ryan Beene

October 19, 2015 - 12:01 am ET

Not too bad, all things considered.

That's what Volkswagen dealers say about the brand's U.S. sales momentum as its diesel emissions scandal enters its second month.

The inability to sell diesel vehicles because of the stop-sale order is taking a toll, but dealers say they have yet to see an exodus of customers from their showrooms as heavy dealer and customer incentives provide a floor under sales.

"It's not a meltdown, but it's not business as usual either," said Mike Sullivan, president of the 11-franchise LAcarGUY network of dealerships, which has two VW stores in greater Los Angeles.

Spooky month

To post a year-on-year U.S. sales gain for October, the VW brand would need a 16% gain over September's sales without the benefit of diesel car sales.

	U.S. sales Sept.	U.S. sales Oct.
2009	17,358	17,037
2010	19,943	20,084
2011	27,036	28,028
2012	36,339	34,311
2013	31,920	28,129
2014	25,996	30,312
2015	26,141	

Source: Automotive News Data Center

Sullivan's VW dealership in Hawthorne, Calif., is on pace to hit its usual monthly volume of around 135 to 140 new VWs. His larger VW store in Santa Monica is off to a slower start, he says, pacing to end the month down by about 30 percent from its typical volume of 200 new VWs a month.

"It's a little off, but nobody's boycotting the stores," Sullivan said.

Sullivan: Sales are “a little off.”

VW dealers across the country are reporting mixed results for the first two weeks of October, which dealers say are typically weaker than the second half of a given month.

Eking out a year-on-year sales gain for the full month would take a minor miracle. Last October, the VW brand sold 30,312 new vehicles, a 7.8 percent gain from October 2013. To beat that total this month, dealers would need to boost sales by 16 percent from September and do so without the diesel-powered models that have accounted for about 20 percent of VW's U.S. sales this year.

Meanwhile, interest in the VW brand from online car shoppers is waning. Consideration and purchase intent for VW vehicles on edmunds.com, already on the decline this year, fell last week to their lowest levels all year, according to the car-shopping website.

Since VW's emissions violations were announced by the EPA on Sept. 18, VW brand traffic at kbb.com fell by 13 percent from the same period in 2014.

At truecar.com, overall VW traffic Oct. 4-10 was off 9 percent compared with the weekly average rate seen for the two months before the scandal, a larger than normal fluctuation, says Eric Lyman, vice president of industry insights at TrueCar. Interest in VW's diesel models, still grounded by the brand's stop-sale order, plummeted by 57 percent in the same window.

Even so, dealers are seeing enough conventional showroom traffic to reassure them that the bottom won't drop out this month. At Herzog-Meier Volkswagen in Beaverton, Ore., diesels account for about 30 percent of monthly, sales says Chris Meier, the dealer principal. But with those models off the market for now, he says, sales of gasoline-powered VWs are picking up and if the store's current momentum continues he could end up posting a small net gain over October 2014.

One big draw is a flood of incentive cash from Volkswagen of America that's intended to help shield dealers from the crisis engulfing the brand and the corporate headquarters in Germany. VW launched a $2,000 owner-loyalty incentive on Oct. 1 that could be combined with any other VW new-car lease or finance offer on gasoline or hybrid models.

The incentive gave a shot in the arm to Open Road Auto Group's two VW dealerships during the first weekend of the month, says Michael Morais, Open Road's president. Through the first two weeks, he says, sales are up at his VW store in Bridgewater, N.J., and his flagship store in downtown Manhattan compared with last October. Diesels account for a smaller share of Open Road's VW sales than the national average, Morais says.

"We remain on track, and the programs are definitely working," Morais said, noting that consumers can finance a new Passat midsize sedan for roughly the same monthly payment as leasing a Honda Civic. "We're making deals, and we're making gross."

Inventory availability and VW's limited selection of crossovers are having as much of an impact on sales as the diesel scandal, if not more, says Chris Curran, president of Curran Volkswagen in Stratford, Conn.

Curran says his midmonth sales were flat compared with last October but could be down by the end of the month. Stocks of the Jetta compact car, Tiguan compact crossover and the 2015 Passat are slim, and a re-engineered 2016 Passat with updated styling and new connectivity technology is months away, Curran says.

Those factors, plus a relatively limited set of existing VW owners nearby to attract with the $2,000 loyalty bonus, have sent sales at Hendrick Volkswagen Frisco in suburban Dallas tumbling to start the month, says Alan Brown, the dealership's general manager and chairman of VW's national dealer council. Brown says sales are on pace to be down by a third from the roughly 90 new VWs he sells in an average month at the Frisco location, "significantly off" from the pace seen in recent months at the store, which is less than a year old.

"The owner loyalty is really helping the dealer who has a customer base," Brown said. "I don't have as much action because I don't have as many people."

Last week, VW announced new dealer advertising support programs at the regional and dealership level to help boost demand. It also created a $2,000 bonus toward a gasoline-powered VW that dealers could offer to consumers who had put down deposits on diesel cars that could not be delivered because of the stop-sale order.

Dealers are also anxious to hear how and when Volkswagen will be able to fix its noncompliant diesels at the brand's national dealer meeting Thursday, Oct. 22, in Orlando and for VW executives to provide a clearer picture of what to expect in the months ahead,

So far, LAcarGUY's Sullivan said, VW has been "dragging their feet on saying anything other than lots of things they're working on. They've got to start saying something a little more profound and specific."

French authorities search Volkswagen office in emissions scandal

BY MARCUS GILMER AND HEIDI MOORE

10 hours ago

Authorities raided a pair of Volkswagen's offices in France on Friday, hitting the company's French headquarters in Villers-Cotterêts and another office in Paris, all in connection with the company's recent emissions scandal.

Investigators from France's environment and public health office conducted the searches Friday at Volkswagen France's offices and seized computer equipment, the Paris prosecutor's office said Sunday. A spokeswoman for Volkswagen France, Leslie Peltier, confirmed the searches and said

Volkswagen is fully cooperating with the police.

According to CNN, authorities in Italy led a similar raid on the Bologna headquarter's of Lamborghini, which is owned by Volkswagen.

The company is struggling to respond to a far-reaching controversy in which Volkswagen and several of its brands — including Porsche and Audi — installed software that was designed to deliberately mislead regulators about the cars' diesel emissions. The software saved Volkswagen the trouble and expense of installing bulky mechanical hardware to reduce the power of their pollutants.

That software tweak, in turn, allowed Volkswagen to falsely claim that the cars — including the hipster-favorite Volkswagen Golf — were environmentally friendly. Many owners, looking to be eco-friendly, felt betrayed by the company's deception.

In the wake of the scandal, Martin Winterkorn stepped down as CEO and the carmaker is feeling heat from all over, including here in the United States where the EPA is investigating if the company used a second piece of software to cheat on emissions tests.

NEW VOLKSWAGEN DISCLOSURE MAY BROADEN EMISSIONS SCANDAL

Oct 18, 2015

The German automaker still has a lot of 'splainin to do about the revelations that it surreptitiously installed "defeat device" software created to cheat on emissions tests in vehicles

with its 2.0-liter turbodiesel engines.

Volkswagen is now in the process of writing to drivers affected, with the German auto manufacturer set to recall cars in January 2016.

"We have a long list of questions for VW about this", Janet McCabe, acting assistant administrator for air quality at the Environmental Protection Agency told the AP.

Hendricks and Gabriel, who leads the SPD, both called for a binding quota for electric cars, with Hendricks also calling for a government subsidy for buying such vehicles.

In the United Kingdom, the consumer magazine 'Which?' has surveyed Volkswagen owners and found that 90 percent of them want compensation over the diesel emissions issue.

Last month, VW became embroiled in the biggest scandal in its history, when USA authorities accused it of fitting diesel cars with devices that can switch on pollution controls when they detect the vehicle is undergoing testing. BMW, Mercedes-Benz, Jeep and even Chevrolet (the Cruze) also sell diesel cars in the USA , but they use different technologies to reduce pollutants, and there's no indication that their emissions test results aren't on the up and up.

The system apparently quickly heats up the NOx trap – the device that traps harmful nitrogen oxides from diesel exhaust – which makes it perform better. Due out as early as 2017, the new electric Phaeton – originally rolled out in 2002 – would go head to head with the Tesla Model S in Europe. VW first told U.S. regulators about the new software on September 29.

He added: "But when I speak to other associations who are not in the press they say that that may not be the case". Thousands of 2016 Beetles, Golfs, Jettas and Passats will remain quarantined in US ports until a fix can be developed, approved and carried out. Herbert Diess announced major product decisions: a reorientation of the diesel strategy with the most advanced technologies, the development of a standardized electric architecture for passenger cars and light commercial vehicles, and a new approach for the next generation of the Phaeton.

"The punitive actions from the EPA are only gong to get more aggressive". The staffer spoke on the condition of anonymity because he was not authorized to talk publicly about the ongoing investigation. The company purposefully made "clean diesel" cars that deceived regulators and customers over their pollution levels, and now it's trying to make a few amends by rolling out a new electric-vehicle initiative.

http://www.ledgergazette.com/german-authorities-to-order-recall-of-2-4-mn-vw-vehicles/114496/

German authorities to order recall of 2.4 mn VW vehicles

BY SHAUN BARTEL ON OCTOBER 17, 2015 WORLD

Volkswagen says it will recall a total of 8.5 million diesel vehicles Europe-wide as police raided the carmaker's office in Italy and those of its sports auto unit Lamborghini over a global pollution-cheating scandal. "Recalls to fix key safety issues that go to the core of a vehicle's operation nearly always occur voluntarily, with the KBA monitoring". Millions more cars are affected worldwide. Embroiled in the worst scandal of its 78-year history, VW also said it plans for an overall shift from diesel technology to electric and plug-in hybrid cars in the near future.

"Volkswagen will be pro-active in approaching and informing customers", the carmaker said. Apart from the company's VW brand, Audi, SEAT and Skoda cars can also be checked.

"Rectifications of the vehicles will begin from January 2016 and will be free of charge for our customers", VW said. It's unclear when the remaining USA cars would be fixed.

Germany's Transport Minister Alexander Dobrindt is set to announce details of the recall later Thursday.

The solutions could involve both software and hardware measures. VW Group had previously suggested that owners bring their cars into dealerships for repairs on a voluntary basis. New parts necessary to fix a few vehicles will probably be ready by next September, he said. But generally manufacturers agree to recalls when asked by the EPA, spokeswoman Laura Allen said.

The company said Friday that it would hire Christine Hohmann-Dennhardt as an executive on the company's top management body tasked with integrity and legal affairs effective from January 1.

Volkswagen has already been ordered to recall almost 500,000 vehicles in the USA, after regulators revealed that it had installed "defeat devices" to ensure they pumped out far less toxic emissions in official tests than on the roads.

Volkswagen on Wednesday denied a report by newsweekly Der Spiegel, which reported based on anonymous sources that at least 30 managers were involved in the decision to install software that disabled emissions controls when vehicles were driven under normal conditions but turned the controls on when the cars were being tested.

http://www.nytimes.com/2015/10/19/business/the-owner-has-a-crucial-part-in-volkswagen-diesel-repair.html?_r=0

Essential Part of the Volkswagen Diesel Repair Is the Owner

By CHRISTOPHER JENSEN OCT. 18, 2015

Even as Volkswagen embarks on the task of fixing the emissions systems it disabled on almost 500,000 of its diesel vehicles in the United States, the automaker faces another hurdle: persuading owners to make the repair at all.

That's because the software that allowed Volkswagen to fool federal emissions tests also lowered the car's performance and fuel economy while the device was turned on. So for owners, the prospect of having a car's emissions cleaned up, only to have the car perform worse — whatever the pollution — is not sitting well.

"If we take a 10 percent hit in our gas mileage, I can live with that, but I won't be happy," said Patrick Downs, who lives in Port Angeles, Wash., and owns a 2013 Jetta TDI.

"If it is 25 percent or more and the performance is degraded to the point where the car has a lot less torque and pickup, that is going to make me very unhappy," he added. "That is going to make me consider not getting the fix."

It was well known among owners of Volkswagen diesels that the cars' advertised fuel economy — as shown on the window sticker — was almost always lower than their real-world performance.

Volkswagen could have saved fuel or improved performance by allowing more pollutants to pass through its cars' exhaust systems, researchers said.

Michael Horn, head of Volkswagen's American unit, told a congressional panel this month that the repairs he outlined — which will take years and require significant new equipment — might result in a slightly lower top speed in the cars. But he was careful to say that the cars' fuel economy would not be lower than the rating on the window sticker.

That's not satisfactory, said Jeff Hinton, the owner of a 2013 Passat diesel. "Every TDI owner will tell you, 'I get much better numbers, miles to the gallon, than any number that is on that Monroney sticker,'" Mr. Hinton, 36, said in a telephone interview from Morrisville, N.C., using a term for the window sticker.

"On recent trips, 500 miles plus, I've gotten 52 to 55 miles per gallon," Mr. Hinton said. The Environmental Protection Agency rating on the window sticker of his Passat is 40

miles per gallon on the highway.

"I wouldn't want my car recalled or reprogrammed or retrofitted in any way if it is going to hurt the performance, because that is not what I paid for," he said.

The E.P.A. cannot force owners to repair their vehicles, said Julia Ortiz, a spokeswoman for the agency.

Automakers also cannot require owners to carry out the emissions recall, just as they cannot force owners to take vehicles in to complete a safety recall.

Some states require vehicles to pass emissions tests before they can be registered each year. But those tests are far less sophisticated than the E.P.A.'s, and the Volkswagens that are not repaired are sure to pass them, said John German, a senior fellow at the International Council on Clean Transportation, which played a crucial role in discovering the automaker's deceit.

That loophole means the air pollution consequences of Volkswagen's action — at least on a small scale — are irreparable if enough owners refuse to have their vehicles fixed.

Despite their small size, the Volkswagen diesels produce a large amount of nitrogen oxide pollutants, Mr. German said, up to 40 times what is allowed under the Clean Air Act. The Passat sedan is emitting an amount of nitrogen oxides similar to that of a modern, medium-duty truck, he said, while the Jetta — and its sibling the Golf — have emissions similar to those of a typical modern 18-wheeler, he said. The Jetta and Golf use a different emissions system than the Passat.

Volkswagen must come up with an incentive plan to make repairing the engines irresistible, said Dan Becker, the director of the Safe Climate Campaign at the Center for Auto Safety.

"Volkswagen made this disaster; it is its responsibility to fix it," he said in a telephone interview. "We need to recognize that consumers may need to have an incentive to do what the law requires."

General Motors, for example, last year offered $25 gift cards to owners of about 2.6 million older small cars that could have defective ignition switches. But unlike the case with the Volkswagens, that was for a potentially fatal defect that has been linked to at least 124 deaths.

The average completion rate of repairs on recalled vehicles in the United States is 75 percent over 18 months, according to the National Highway Traffic Safety Administration.

Some states try to address the issue of owners who do not comply with air pollution recalls.

New Jersey has a law requiring owners to have emissions recalls carried out on their vehicles and to provide proof in order to register them. But it has never been used and it would be "premature and speculative" to discuss how that law might apply to Volkswagen, said Mairin Bellack, a spokeswoman for the state's Motor Vehicle Commission.

California also requires owners to have their vehicles repaired, said Stanley Young, a spokesman for the California Air Resources Board. The automaker has until Nov. 20 to submit a remedy to California regulators, which must then be approved.

"If it turns out that there is not enough of a response, we do have in California the option of putting a block on registration until the fix is done," he said. "But that is only as a last resort."

Even before Volkswagen announced the recall remedy, diesel owners fretted about the impact.

"Do not take your car to the dealer for service (if it's out of warranty) as they will automatically install the eventual software fix if you do," an owner wrote on the Volkswagen Owners Club website. "This software fix will allow the car to pass emissions, but it will lower MPG, decrease performance and finally reduce component life of the engine and emissions system."

But some emissions experts say it's hard to predict the consequences, since it is not clear exactly what Volkswagen did.

Federal regulators have said the automaker installed software that signaled the emissions system to work during the E.P.A. tests, but then at least partly disabled it during routine driving.

Even the motivation is unclear.

"Fuel economy could be a factor but it need not be the factor," said Arvind Thiruvengadam, research professor at West Virginia University, which helped uncover VW's cheating. "Meeting lower emissions means it is also a lot of burden on other components of the vehicle."

Part of the strategy, then, could have been to minimize mechanical wear and tear, he said.

Mr. German at the International Council on Clean Transportation said that what all this meant to diesel owners would not be clear until Volkswagen provided far more information.

He said there might be a loss in fuel economy, although he would be surprised if it was significant. "It shouldn't be, like eight miles per gallon or anything like that," he said.

Consumer Reports tested two Volkswagen diesels, with and without the cheating software activated. In one of the cases, a 2015 Jetta TDI got 53 m.p.g. without the modification used

to cheat, compared with 50 m.p.g. with it. The advertised fuel economy was 45 miles per gallon.

Mr. German said he would be surprised if the smooth delivery of power without hesitation or surges was a major problem because vehicles today have advanced fuel-injection systems and sophisticated computers.

"It is rare for there to be a drivability problem," he said. "You can almost always figure out some way to manage it."

That leaves owners like Mr. Downs in Washington State, who is waiting to see how his Jetta diesel will be affected and what to do about the recall. But he readily acknowledges he is pondering the environmental downside of not repairing the car.

"What does this mean in terms of actual environmental impact?" he said. "It is millions of cars. That weighs heavy on my mind."

NYSE Post:

VW commercials getting a new view in light of emissions scam

Oct 19 2015

"Diesel in Latin means 'soiled, '" chimes in one other pal within the backseat.

"See how clear it's!" she exclaims, holding up the spotless scarf.

When asked by the House of Representatives' Energy and Commerce Committee' s Oversight and Investigation subcommittee recently, instead of coming clean, Volkswagen US CEO Michael Horn just chose to blame it on the software engineers. The device converts smog-triggering nitrogen oxide into harmless oxygen and nitrogen gases.

For years, the company aired memorable TV spots using terms such as “miraculous” to describe the car’s seemingly too-good-to-be-true balance of peppy acceleration, 40-mile-per-gallon gas mileage and low greenhouse gas emissions. While the FTC can't send anyone to jail, it has authority to protect consumers and impose wide-ranging penalties.

"That a separate device was included in the redesigned 2016 cars could suggest a multi-year effort by the company to influence USA emissions tests that continued even after regulators began pressing the company last year about irregularities with the emissions produced by the older cars".

VW is now working with regulators to continue the certification process needed to sell its 2016 diesel cars. Those could potentially include paying cash restitution to the affected vehicle owners and forcing VW to buy new national ads admitting the company lied to its customers. If you would like to discuss another topic, look for a relevant article.

The ads have additionally been faraway from the corporate's web sites and YouTube channel. Jeannine Minivan, the spokesperson from Volkswagen, confirmed that the 2016 models feature new software dubbed "auxiliary emissions control device" and this information was disclosed to the California and US EPA regulators last week.

VW is now coordinating with the Environmental Protection Agency on an anticipated recall of the nearly 500,000 bought within the D.R. because the suspect software program first appeared in its 2009 diesel fashions. Owners can key of their auto identification quantity stamped on the dashboard close to the driving force's windshield.

A month into VW scandal, no sales meltdown

Dealers reporting mixed results

Ryan Beene

October 19, 2015 - 12:01 am ET

Not too bad, all things considered.

That's what Volkswagen dealers say about the brand's U.S. sales momentum as its diesel emissions scandal enters its second month.

The inability to sell diesel vehicles because of the stop-sale order is taking a toll, but dealers say they have yet to see an exodus of customers from their showrooms as heavy dealer and customer incentives provide a floor under sales.

"It's not a meltdown, but it's not business as usual either," said Mike Sullivan, president of the 11-franchise LAcarGUY network of dealerships, which has two VW stores in greater Los Angeles.

Spooky month

To post a year-on-year U.S. sales gain for October, the VW brand would need a 16% gain over September's sales without the benefit of diesel car sales.

U.S. sales Sept. U.S. sales Oct.

2009 17,358 17,037

2010	19,943	20,084
2011	27,036	28,028
2012	36,339	34,311
2013	31,920	28,129
2014	25,996	30,312
2015	26,141	

Source: Automotive News Data Center

Sullivan's VW dealership in Hawthorne, Calif., is on pace to hit its usual monthly volume of around 135 to 140 new VWs. His larger VW store in Santa Monica is off to a slower start, he says, pacing to end the month down by about 30 percent from its typical volume of 200 new VWs a month.

"It's a little off, but nobody's boycotting the stores," Sullivan said.

Sullivan: Sales are “a little off.”

VW dealers across the country are reporting mixed results for the first two weeks of October, which dealers say are typically weaker than the second half of a given month.

Eking out a year-on-year sales gain for the full month would take a minor miracle. Last October, the VW brand sold 30,312 new vehicles, a 7.8 percent gain from October 2013. To beat that total this month, dealers would need to boost sales by 16 percent from September and do so without the diesel-powered models that have accounted for about 20 percent of VW's U.S. sales this year.

Meanwhile, interest in the VW brand from online car shoppers is waning. Consideration and purchase intent for VW vehicles on edmunds.com, already on the decline this year, fell last week to their lowest levels all year, according to the car-shopping website.

Since VW's emissions violations were announced by the EPA on Sept. 18, VW brand traffic at kbb.com fell by 13 percent from the same period in 2014.

At truecar.com, overall VW traffic Oct. 4-10 was off 9 percent compared with the weekly average rate seen for the two months before the scandal, a larger than normal fluctuation, says Eric Lyman, vice president of industry insights at TrueCar. Interest in VW's diesel models, still grounded by the brand's stop-sale order, plummeted by 57 percent in the same window.

Even so, dealers are seeing enough conventional showroom traffic to reassure them that the bottom won't drop out this month. At Herzog-Meier Volkswagen in Beaverton, Ore., diesels account for about 30 percent of monthly, sales says Chris Meier, the dealer principal. But with those models off the market for now, he says, sales of gasoline-powered VWs are picking up and if the store's current momentum continues he could end up posting a small net gain over October 2014.

One big draw is a flood of incentive cash from Volkswagen of America that's intended to help shield dealers from the crisis engulfing the brand and the corporate headquarters in Germany. VW launched a $2,000 owner-loyalty incentive on Oct. 1 that could be combined with any other VW new-car lease or finance offer on gasoline or hybrid models.

The incentive gave a shot in the arm to Open Road Auto Group's two VW dealerships during the first weekend of the month, says Michael Morais, Open Road's president. Through the first two weeks, he says, sales are up at his VW store in Bridgewater, N.J., and his flagship store in downtown Manhattan compared with last October. Diesels account for a smaller share of Open Road's VW sales than the national average, Morais says.

"We remain on track, and the programs are definitely working," Morais said, noting that consumers can finance a new Passat midsize sedan for roughly the same monthly payment as leasing a Honda Civic. "We're making deals, and we're making gross."

Inventory availability and VW's limited selection of crossovers are having as much of an impact on sales as the diesel scandal, if not more, says Chris Curran, president of Curran Volkswagen in Stratford, Conn.

Curran says his midmonth sales were flat compared with last October but could be down by the end of the month. Stocks of the Jetta compact car, Tiguan compact crossover and the 2015 Passat are slim, and a re-engineered 2016 Passat with updated styling and new connectivity technology is months away, Curran says.

Those factors, plus a relatively limited set of existing VW owners nearby to attract with the $2,000 loyalty bonus, have sent sales at Hendrick Volkswagen Frisco in suburban Dallas tumbling to start the month, says Alan Brown, the dealership's general manager and chairman of VW's national dealer council. Brown says sales are on pace to be down by a third from the roughly 90 new VWs he sells in an average month at the Frisco location, "significantly off" from the pace seen in recent months at the store, which is less than a year old.

"The owner loyalty is really helping the dealer who has a customer base," Brown said. "I don't have as much action because I don't have as many people."

Last week, VW announced new dealer advertising support programs at the regional and dealership level to help boost demand. It also created a $2,000 bonus toward a gasoline-powered VW that dealers could offer to consumers who had put down deposits on diesel cars that could not be delivered because of the stop-sale order.

Dealers are also anxious to hear how and when Volkswagen will be able to fix its noncompliant diesels at the brand's national dealer meeting Thursday, Oct. 22, in Orlando and for VW executives to provide a clearer picture of what to expect in the months ahead,

So far, LAcarGUY's Sullivan said, VW has been "dragging their feet on saying anything other than lots of things they're working on. They've got to start saying something a little

more profound and specific."

French authorities search Volkswagen office in emissions scandal

BY MARCUS GILMER AND HEIDI MOORE

10 hours ago

Authorities raided a pair of Volkswagen's offices in France on Friday, hitting the company's French headquarters in Villers-Cotterêts and another office in Paris, all in connection with the company's recent emissions scandal.

Investigators from France's environment and public health office conducted the searches Friday at Volkswagen France's offices and seized computer equipment, the Paris prosecutor's office said Sunday. A spokeswoman for Volkswagen France, Leslie Peltier, confirmed the searches and said Volkswagen is fully cooperating with the police.

According to CNN, authorities in Italy led a similar raid on the Bologna headquarter's of Lamborghini, which is owned by Volkswagen.

The company is struggling to respond to a far-reaching controversy in which Volkswagen and several of its brands — including Porsche and Audi — installed software that was designed to deliberately mislead regulators about the cars' diesel emissions. The software saved Volkswagen the trouble and expense of installing bulky mechanical hardware to reduce the power of their pollutants.

That software tweak, in turn, allowed Volkswagen to falsely claim that the cars — including the hipster-favorite Volkswagen Golf — were environmentally friendly. Many owners, looking to be eco-friendly, felt betrayed by the company's deception.

In the wake of the scandal, Martin Winterkorn stepped down as CEO and the carmaker is feeling heat from all over, including here in the United States where the EPA is investigating if the company used a second piece of software to cheat on emissions tests.

SUPREME COURT:

Justice's wife dumps energy stock tied to FERC case

Robin Bravender, E&E reporter

Published: Friday, October 16, 2015

When Supreme Court Justice Stephen Breyer heard arguments in a major energy case this week, his wife had a financial stake in one of the companies involved.

Breyer's wife, Joanna, owned stock in Johnson Controls Inc., whose subsidiary is a party in a pending case over a government rule aimed at incentivizing consumers to cut electricity use through a practice called "demand response." Johnson Controls owns EnergyConnect Group Inc., a company that provides

demand response technologies and is among those urging the high court to uphold the rule.

Joanna Breyer owned 750 shares of Johnson Controls when Justice Breyer heard the case Wednesday, Supreme Court Clerk Scott Harris wrote in a letter yesterday to attorneys involved in the case. A check conducted by Breyer's office failed to flag the potential conflict, and Breyer's wife sold all of those shares yesterday, the letter says.

Breyer plans to stay involved in the case.

"Justice Breyer has devoted substantial judicial time to this case," Harris wrote. "He has no reason to believe that the financial interest could be substantially affected by the outcome of the case."

Breyer's wife sold her Johnson Controls stock for about $33,000 yesterday, according to Bloomberg, which first reported news of the stock sale.

Justice Samuel Alito had already recused himself from the case, presumably because he also held stock in Johnson Controls, although justices rarely publicly disclose reasons for recusing themselves. In 2014, Alito reported stock in Johnson Controls among his assets, according to a disclosure published by the Center for Public Integrity.

"It's not necessarily uncommon for justices and their spouses to be unaware of holdings in companies, especially when they're fairly widely invested as are Justice Breyer and his wife," said Russell Wheeler, an expert on judicial ethics and visiting fellow at the Brookings Institution.

Justices are required to divest or recuse themselves in cases where they or their spouses own even a single share of stock in a company that's a party to a case before the court, Wheeler said.

Jonathan Adler, a professor at the Case Western Reserve University School of Law, said, "Judges are certainly encouraged to invest in things like mutual funds rather than individual stocks to avoid these sorts of problems."

But it can be "difficult when you have things that are owned jointly or things that are owned by a spouse," Adler said. "In a case like this, I don't think there's any reason to doubt that Justice Breyer sat on the case without any awareness of the financial interest."

In 2013, Breyer had an estimated net worth of about $11 million, according to the Center for Responsive Politics.

TRANSPORTATION:

Leaders of House panel unveil long-term funding bill

Sean Reilly, E&E reporter

Published: Friday, October 16, 2015

Leaders of the House Transportation and Infrastructure Committee released a long-term road and transit authorization bill today that would maintain existing funding levels adjusted for inflation for as long as fiscal 2021.

The approximately 540-page bipartisan bill comes with a large question mark. While the committee plans a markup for Thursday, it's going forward without a path for fully covering the $325 billion cost -- the job of

the Ways and Means Committee.

A senior T&I Committee aide said he expects the Ways and Means panel to come up with a funding package within the next few weeks that would pay for the first three years. Without that package, which has been awaited for months, the bill will not move to the House floor.

"I don't think we will take an unfunded bill to the floor," the aide said at a background briefing for reporters.

According to the briefing and a summary, the transportation measure would also:

- Create a National Surface Transportation and Innovative Finance Bureau within the Department of Transportation to provide "one-stop shopping" for states, local governments and businesses seeking to pursue projects. About a half-dozen DOT offices would be consolidated.

- Revamp federal truck and bus safety grant programs.

- Update transportation research standards to reflect technological advances.

The House is currently playing catch-up with the Senate, which passed a road, railroad and transit authorization bill in July that contains assured funding for three years.

The Senate measure would also extend the December deadline for implementation of the automated rail safety system known as positive train control until the end of 2018.

While House Transportation Chairman Bill Shuster (R-Pa.) recently introduced a stand-alone bill to grant a three-year extension under somewhat different conditions, the committee aide this morning didn't rule out incorporating a compromise into the final version of broader surface transportation legislation.

More immediately, however, lawmakers must agree on another short-term extension to replace the existing stopgap road and transit funding authorization measure that expires Oct. 29, given that there is no chance of lawmakers sending a longer-term measure to President Obama before then.

Any new stopgap would be the fourth since July of last year; no agreement has been reached on its length, the aide said.

EPA:

Senators ask agency to return millions in unused funds

Kevin Bogardus, E&E reporter

Published: Friday, October 16, 2015

Sens. Jeff Flake (R-Ariz.) and Claire McCaskill (D-Mo.) are calling on U.S. EPA to return millions of dollars unused by the agency to the Treasury.

In a letter sent yesterday to EPA Administrator Gina McCarthy, the senators note the agency inspector general in a recent report uncovered nearly $137 million in unspent funds as of February 2015. Flake and McCaskill then ask EPA to consider returning the money in light of the federal government's ever-present budgetary needs.

"Given persistent fiscal concerns, it is clear that taxpayers would benefit from unobligated or unspent funds being returned to the U.S. Treasury in an expedient fashion," the senators said in their letter to McCarthy.

Released last month, the IG report focused on $6.2 million that was destined for water projects that had not been spent. The agency watchdog recommended that the Office of Water take action and spend the funds.

The IG also praised the agency for significantly reducing its amount of unspent funds since 2010, when the agency once had more than $900 million in unspent funds, according to a 2010 annual report.

The $137 million figure, however, sparked Flake and McCaskill's interest, and they're now asking EPA to provide a full accounting for that money.

"We believe EPA must look closely at the entire $137 million in unobligated and unspent funds, which have missed EPA's own targets for awarding and closing out grants," the senators say in their letter.

Flake and McCaskill ask the EPA chief for several items, including when the agency plans to complete the IG's recommendations as well as lists of unobligated funds that EPA intends to return to the Treasury and unobligated funds the agency recommends for rescission by Congress.

Melissa Harrison, an EPA spokeswoman, said the agency will review Flake and McCaskill's letter and plans to respond.

BIOFUELS:

Calif. Democrats urge EPA to boost refiner targets

Amanda Reilly, E&E reporter

Published: Friday, October 16, 2015

Seven Democrats in California's congressional delegation called this week for stronger annual renewable fuel requirements for refiners.

The lawmakers slammed a U.S. EPA proposal setting 2014, 2015 and 2016 renewable fuel targets, as well as the biodiesel target through 2017, warning that it threatened to "halt the progress" in bringing second-generation biofuels to scale.

While the proposal EPA released in May would increase year-over-year mandates for refiners under the federal renewable fuel standard program, it calls for less renewable fuel use than Congress wrote into the 2007 statute that enacted the RFS.

"As EPA works to develop the final rule," the lawmakers wrote in a letter to Administrator Gina McCarthy, "we urge it to take action to get the RFS back on track and ensure consumers have access to the cleanest and most affordable transportation fuels."

The letter comes as several groups opposed to the renewable fuel standard launched a new ad campaign in the Washington, D.C., area calling for the elimination of federal corn ethanol requirements.

Rep. Eric Swalwell of California led the Oct. 14 effort, with fellow Democratic Reps. Julia Brownley, Susan Davis, Sam Farr, Scott Peters, Loretta Sanchez and Jackie Speier signing on to the letter.

The lawmakers credit the renewable fuel standard with supporting 60,000 jobs in California, based on data collected by pro-RFS group Fuels America. They argue that the standard has helped develop the domestic advanced biofuels industry, which is generally accepted to deliver greater greenhouse gas benefits than corn ethanol.

According to the letter, EPA's proposal threatens to remove incentives for the oil industry to invest in next-generation fuels.

They also questioned EPA's justification for proposing lower renewable fuel levels than Congress laid out in the 2007 statute. EPA has based the proposal mostly on a short-term limit to the amount of ethanol that can be distributed in existing fuel infrastructure.

"[T]he very purpose of the RFS was to create a market for renewable fuels," the lawmakers wrote. "And, the reality is distribution [waivers] are not necessary because the statute can be met with our existing infrastructure."

Rep. Jim Costa (D-Calif.), in contrast, has taken a strong position against the renewable fuel standard, co-sponsoring bipartisan legislation that would eliminate corn ethanol requirements and require EPA to set certain advanced biofuel targets at actual production levels.

Costa has raised concerns about the RFS's effects on livestock producers, food manufacturers and energy producers (*Greenwire*, Feb. 4).

Those sectors have called on EPA to set even lower renewable fuel targets in its final rule, which EPA is poised to release by Nov. 30.

Today, groups opposed to federal mandates for ethanol launched what they called a significant ad buy in the Washington, D.C., area. The television ad, which will run for several weeks in the Beltway, cites recent studies that question the greenhouse gas benefits of corn ethanol.

It also highlights former Vice President Al Gore's 2010 statement that supporting first-generation ethanol was a "mistake."

"Mounting scientific evidence has revealed the inconvenient truth: Increasing ethanol mandates can actually make things worse," a voiceover says in the ad.

The American Council for Capital Formation, National Council of Chain Restaurants and National Marine Manufacturers Association are funding the ad.

CLIMATE:

Brookings calls for 'substantive dialogue' on CCS

Manuel Quiñones, E&E reporter

Published: Friday, October 16, 2015

The federal government should do more to encourage the commercial deployment of carbon capture and sequestration technologies to address climate change, the Brookings Institution said in a report released today.

The 70-page policy brief is meant to "reignite substantive dialogue on the role of CCS," particularly ahead of next month's Paris global climate talks.

Its authors -- Tim Boersma and John Banks with Brookings' Energy Security and Climate Initiative -- want policymakers to look beyond concerns about continued reliance on fossil fuels and the lack of widespread commercial deployment of CCS.

"Despite these challenges, CCS has undisputed potential to serve as a key component of a carbon mitigation portfolio for the electricity, petrochemical and other industries," they wrote. "Moreover, there are numerous studies that have concluded that in the long-term CCS can be a cost effective measure to reduce global CO2 emissions."

The paper concludes that the U.S. government is not doing enough to promote the commercial deployment of the technology.

"Indeed, CCS seems to be caught in a classic policy dilemma," the paper says, "while some governments view CCS as a low carbon option, without a government requirement or strong incentive to significantly reduce CO2 emissions there is little or no incentive for the private sector to develop and deploy CCS technology."

The report recommends strong federal carbon controls or pricing that utilities and environmentalists say would encourage CCS but are opposed by the coal industry.

The paper also calls on the federal government to modify tax credits for CCS development, creating a CCS trust fund and making sure power producers can recoup the cost of producing power from plants with carbon capture.

Using trapped CO2 to stimulate old oil and gas wells, the paper says, would help pay for the cost of capture technology and provide an alternative to finding places for underground long-term storage.

Responding to the report, Paul Bledsoe, a former Clinton White House climate official, said, "CCS has unique bipartisan political and policy appeal because Republicans realize it can provide an avenue for more domestic coal use and enhanced oil recovery, and Democrats understand it will be needed to cut emissions very deeply, including from natural gas and industrial sources."

He added, "You might look to more thoughtful presidential candidates to propose incentives needed to get wide-scale commercial deployment, including from an international competitiveness perspective."

The coal industry had been looking for Democratic presidential front-runner Hillary Clinton to renew her support for coal-related technologies. But she has been more focused recently on a Democratic base increasingly critical of fossil fuels.

The Obama administration has set aside billions of dollars for CCS, including from the 2009 stimulus bill, but the Department of Energy returned more than $1 billion to the Treasury in recent weeks because projects did not spend the money on time.

The Niskanen Center, a libertarian think tank, penned a blog post this month about grim recent developments, including Southern Co. delays in opening its Kemper coal plant, which would curb most carbon emissions and use the gas for enhanced oil recovery.

"The failure -- for that is what it is -- of recent U.S. CCS efforts blows a hole in any comfortable assumption that CCS can be major contributor to near-term mitigation efforts," the group said. "But it remains a critically important technology that has to be got right."

Niskanen advocates agree with at least some of Brookings' recommendations, including creating a federal carbon policy and a regulatory system encouraging CCS.

"More government money may also be needed, but without those two prerequisites, CCS will not succeed no matter how many billions we throw at it," David Bailey and David Bookbinder wrote in the post.

Bailey and Bookbinder also encouraged the coal industry to be involved in the CCS effort. But so far, many utilities have focused more on moving away from coal and miners and on attacking administration rules, including one requiring carbon capture for all new coal plants (*Greenwire*, Aug. 4).

Despite DOE pulling funding for the FutureGen 2.0 carbon capture project in Illinois because of stimulus bill spending deadlines, companies appear to be keeping the FutureGen Alliance alive to promote efforts to burn coal cleaner.

In Congress, Democratic Sens. Joe Manchin of West Virginia and Heidi Heitkamp of North Dakota have floated bills to boost aid to CCS and encourage commercial deployment (*E&E Daily*, May 15).

Broad energy bills in both the House and Senate include some of their ideas, but nothing close to what analysts at Brookings and elsewhere recommend (*Greenwire*, Sept. 29).

Still, enemies of aiding CCS include conservatives who would rather not see the government involved in energy development. And environmental groups like the Sierra Club would rather see spending on renewables rather than technology that may end up keeping fossil fuel plants running.

CAMPAIGN 2016:

NextGen ads urge pledge for goal of 50% renewables by 2030

Jennifer Yachnin, E&E reporter

Published: Friday, October 16, 2015

Environmental activists at NextGen Climate yesterday unveiled the group's latest step in its bid to push presidential primary contenders to embrace renewable energy policies, launching a new million-dollar ad campaign in New Hampshire and Iowa.

The political action committee, backed by California billionaire environmentalist Tom Steyer, is pushing candidates from both major parties to adopt platforms that would shift the country's energy production to 50 percent renewable resources by 2030.

"Climate change is an urgent threat -- but it is also America's opportunity to build a clean energy economy that strengthens our country and builds the jobs of the future," Steyer said in a statement announcing the new ad campaign. "It's simply not enough to recognize the threat of climate change anymore -- Americans are looking to our leaders for concrete solutions."

But the new television spots, which NextGen said are part of a "seven-figure" television ad buy along with a "six-figure" digital campaign, do not target any would-be presidential candidates by name.

Instead, the 30-second television spot frames climate change as an economic issue.

"If you think storm damage is the only cost of climate change, think again," a female narrator states over footage of flooded roadways and a bridge. "From the rising price of food to higher insurance rates for homes and businesses, the economic damage will only get worse. But with American-made clean energy, we can save money on electricity and spur innovation to create new businesses and jobs. It all starts with 50 percent clean energy by 2030. So what are we waiting for?"

The 30-second digital ad, which will target viewers in Florida, Iowa, New Hampshire and Ohio, asserts the next president should adopt the energy proposal and urges viewers to use the social media hashtag #50BY30.

"America is on the brink of something huge," a male narrator states in the spot, which features text and simple graphics on an orange background. "The clean energy economy is taking off, generating millions of American jobs. A clean energy economy is possible and within reach. We need our next president to join the movement with a concrete plan to achieve at least 50 percent clean energy by 2030. Fifty by 30. Join us."

To date, only former Maryland Gov. Martin O'Malley (D) has proposed a similar plan, calling for a total shift to renewable energy sources by 2050, while former Secretary of State Hillary Clinton said a third of the nation's energy generation should be powered by renewable sources by 2020.

CAMPAIGN 2016:

Climate 'is a real issue' -- Sen. Ayotte

Published: Friday, October 16, 2015

Sen. Kelly Ayotte (R-N.H.) broke with much of her party yesterday by saying that humans should work to reduce their contribution to climate change.

"I believe that it is a real issue, that obviously man-made activity is contributing to carbon dioxide emissions and that we should be of course working on solutions that I hope are common-sense solutions," Ayotte said in an interview after a roundtable discussion with conservationists at Dartmouth College focusing on her support of the Land and Water Conservation Fund.

Ayotte expressed support for "energy efficiency and other measures to help reduce the impact that carbon has on our environment."

Ayotte is expected to face a tough challenge for re-election next year against New Hampshire Gov. Maggie Hassan (D), a vocal supporter of fighting climate change.

The senator's move is likely an attempt to win over environmentally conscious independents, said Dean Spiliotes, a civic scholar at Southern New Hampshire University.

"There are people out there who are almost single-issue voters on climate change -- those folks are unlikely to vote for her in any event," since their votes usually go to Democrats, he said (Rob Wolfe, Lebanon [N.H.] *Valley News*, Oct. 16). **-- BTP**

RENEWABLE ENERGY:

Group asks Supreme Court to review Colo. standard

Robin Bravender, E&E reporter

Published: Friday, October 16, 2015

A conservative legal group is asking the Supreme Court to weigh the constitutionality of Colorado's renewable energy standard after a lower court upheld the state's program.

The anti-regulatory nonprofit Energy & Environment Legal Institute has filed a petition asking the high court to examine the decision made by the Denver-based 10th U.S. Circuit Court of Appeals earlier this year, the group announced this week.

A three-judge panel on that court unanimously upheld Colorado's requirement that 20 percent of all electricity sold in the state come from renewable sources (*E&ENews PM*, July 13).

Lawyers for Energy & Environment Legal Institute have argued that Colorado's standard illegally regulated economic activity outside the state's borders because the state is part of an electric grid that serves 11 states and parts of Mexico and Colorado. Consequently, the group argued that the law discriminated against coal and other fossil fuel generators located outside Colorado.

The Colorado RES "is a classic example of an extraterritorial regulation that independently violates the system as a whole," the group wrote in its petition to the high court.

"Colorado is not alone in its efforts to tell other states how to regulate," Energy & Environment Legal Institute said in a statement. "California has the hubris to tell egg producers in Iowa what size chicken pens have to be. They have also told Canada how to make goose liver. Indeed, there is a growing effort for states to try to export their regulations onto other states."

David Schnare, the group's general counsel, said "a state may not project its legislation into other states and may not control conduct beyond the boundaries of the state."

Judge Neil Gorsuch, a Republican appointee, wrote in the 10th Circuit opinion that the challengers had failed to establish that Colorado's renewable portfolio standard, or RPS, would actually harm out-of-state producers compared to in-state generators.

"[A]s far as we know, all fossil fuel producers in the area served by the grid will be hurt equally and all renewable energy producers in the area will be helped equally," he wrote. "If there's any disproportionate adverse effect felt by out-of-state producers or any disproportionate advantage enjoyed by in-state producers, it hasn't been explained to this court. And it's far from clear how the mandate might hurt out-of-state consumers either."

The Colorado case was closely watched by environmental and industry groups as more states have adopted renewable requirements. The 9th U.S. Circuit Court of Appeals in San Francisco in 2013 rejected a similar challenge to California's low-carbon fuel standard, a central part of the state's efforts to tackle climate change (*E&ENews PM*, Sept. 18, 2013).

NATURAL GAS:

Pipeline explodes in South Texas

Published: Friday, October 16, 2015

A natural gas pipeline exploded early this morning in southern Texas, causing a large fire that closed local

schools and drove some residents from their homes.

The Lewis Energy Group pipeline outside Encinal, Texas, exploded around 4 a.m. local time today, according to City Manager Velma Davila. No injuries were reported and no evacuations have been ordered, but local schools were closed and some residents came to City Hall to escape the intense heat caused by the still-burning pipeline.

"We are currently investigating the cause of the incident," Tony Trevino, general counsel for Lewis Energy, said in a statement.

The Texas Railroad Commission, which supervises pipelines and not trains in the state, also said it was looking into the incident (Ben Spicer, KSAT, Oct. 16). **-- BTP**

BIOFUELS:

EPA's internal watchdog starts RFS study

Amanda Reilly, E&E reporter

Published: Friday, October 16, 2015

With the Obama administration under growing political pressure over its contentious renewable fuel standard, U.S. EPA's inspector general announced plans yesterday to study the agency's implementation of the program.

The Office of Inspector General said in a memo to top EPA air and science officials that the study would determine whether the agency complied with RFS reporting requirements.

Investigators are also seeking information on whether EPA has updated its life-cycle analysis of biofuels' greenhouse gas impacts as it receives new data from studies required by law.

"The anticipated benefits of this project," OIG said, "are to ensure public health and the environment are protected by verifying the EPA is complying with reporting requirements, and is considering statutorily mandated studies when promulgating the RFS."

Congress passed legislation setting up the current version of the RFS in 2007, calling for refiners to use increasing amounts of ethanol and advanced biofuels in petroleum gasoline and diesel through 2022.

The OIG study comes as many industry sectors and academics are questioning the benefits of the policy. Earlier this week, University of Tennessee researchers found the RFS has not delivered on its promised greenhouse gas reductions and other environmental benefits (*Greenwire*, Oct. 15).

Under the RFS program, EPA is required to determine through a life-cycle analysis whether different biofuels achieve greenhouse gas reductions. Renewable fuels must achieve certain thresholds of reductions before refiners can use them to meet their annual biofuel requirements.

OIG said it planned to look specifically at whether EPA incorporated the results of a 2011 study by the National Academy of Sciences on biofuels into its life-cycle analyses. That study questioned whether the RFS was an effective policy for achieving greenhouse gas reductions largely because of land-use changes associated with ethanol production.

The office said it will also look at how EPA used the results from its first report to Congress in 2011 on the

renewable fuel standard. That report concluded that there could be negative effects associated with increased biofuels production but said the extent of the effects depended on the choice of biofuel feedstock, whether conservation practices were used to grow biofuel crops and the efficiency of future biofuel technology.

OIG asked EPA officials to furnish certain information, including documentation of the agency's response to the 2011 National Academy of Sciences study and reports to Congress.

Supporters of biofuels have credited the RFS for achieving greenhouse gas reductions and point to research from Argonne National Laboratory that has found corn ethanol production decreases emissions by more than 30 percent compared to a gasoline baseline.

Biofuel producers have given EPA heat recently for a proposal to lower the annual RFS mandates for refiners compared to the levels Congress wrote into the 2007 statute.

TRANSPORTATION:

Cash woes, competing agendas stymie high-tech traffic systems

Sean Reilly, E&E reporter

Published: Friday, October 16, 2015

Widespread use of high-tech traffic management systems is likely decades away in the United States, hampered by a lack of money, the need to develop technical standards and a potential squeeze on wireless spectrum space, according to a new report by the Government Accountability Office.

"Vehicle-to-infrastructure" (V2I) technologies could help further reduce car-related crash and injury rates that are already down substantially over the last 20 years, thanks to greater use of automobile air bags and other developments, the report said.

Such technologies, for example, could warn drivers of dangerous weather conditions, such as roadway ice and fog, and set traffic signals to give priority to firefighters and other emergency responders. During the next five years, the Department of Transportation plans to spend up to $100 million trying them out in real-world settings.

But it will be up to states and local governments to put such systems into everyday use. Many states are already facing lean budgets; they are also affected by the Highway Trust Fund's eroding financial condition and the complications posed by the federal government's current fiscal outlook, GAO reviewers said.

Accordingly, many states and localities "may lack resources for funding both V2I equipment and the personnel to install, operate and maintain the technologies," they wrote. In Japan, by contrast, the national government covered the bulk of the cost for installing such systems.

Also essential to routine use are technical standards to ensure that V2I systems work on all types of vehicles and devices. Developing such standards could be difficult because of the differing political, economic and industry-related agendas that a large array of players bring to the table, one expert told the GAO. And while a specific piece of the wireless radio frequency spectrum has already been set aside for vehicle-to-infrastructure systems and other forms of "intelligent transportation," some lawmakers are pressing to open it up to other users. That could interfere with the immediate data transfers needed to make V2I technology effective.

The report, which draws on input from 21 experts, was requested by Reps. Barbara Comstock (R-Va.) and Daniel Lipinski (D-Ill.), the chairwoman and ranking member, respectively, of the Science, Space and Technology Subcommittee on Research and Technology, as well as by Rep. Larry Bucshon (R-Ind.), a member of the Energy and Commerce Committee.

AIR POLLUTION:

Fix could soon be ready for some Volkswagen diesels

Published: Friday, October 16, 2015

U.S. regulators anticipate receiving a proposed fix this week for some of the diesel Volkswagen vehicles involved in the company's emissions-testing scandal.

A software patch could soon be available for 2012-14 Passat TDI models, U.S. EPA spokeswoman Laura Allen said yesterday. Regulators would have to approve the patch before it is sent to Volkswagen dealers.

The Passat sedans have Volkswagen's Second Generation emissions-control technology; Generation 1 and Generation 3 vehicles will likely take longer to fix (Michael Biesecker, AP/*Columbus Dispatch*, Oct. 16). **-- BTP**

ELECTRIC VEHICLES:

Businesses, government bulk up EV fleet in Calif.

Published: Friday, October 16, 2015

Corporations and government bodies will be adding hundreds more electric vehicles and charging stations to their fleets in California.

Marine Corps and Navy bases will use 450 more electric vehicles, leaders announced yesterday in Los Angeles, while several major utilities and large businesses including Coca-Cola Co. made similar pledges (AP/*Billings Gazette*, Oct. 16). **-- BTP**

NORWAY:

Nation's push toward electric vehicles serves as global model

Published: Friday, October 16, 2015

Norway is on the leading edge of encouraging its citizens to adopt electric vehicles, and policymakers worldwide are taking notice.

More than one-fifth of new car sales in Norway are electric, and the country has a higher percentage of electric vehicles than any other in the world at 2 percent. In many ways, the growth reflects the country's overall interest in renewable energy; it is one of the biggest producers of hydropower on Earth.

"If there's anyone in the world who should be using electric vehicles, it's Norway," said Julian Marshall, a professor of environmental engineering at the University of Minnesota. "That's a place with clean energy."

To encourage use of electric cars, Norway decided it would essentially exempt them from the otherwise expensive life of owning a car in the country. Thus electric vehicle owners do not have to pay the 25 percent sales tax for cars or the roughly $12,000 registration fee, and parking, tolls and ferry fees are waived for them. Since gasoline in Oslo averages $6 per gallon, owners are also avoiding a costly fill-up with every charge.

Some in Norway have expressed worry over the expense of these tax breaks, but many hope to see the rapid growth continue.

"If we can continue like this until 2020, we will change the car industry," said Christina Bu, head of the Norwegian Electric Vehicle Association (David Jolly, *New York Times*, Oct. 16). **-- BTP**

Greenwire's Northey talks next steps for demand response rule following SCOTUS review

Published: Friday, October 16, 2015

Following the Supreme Court's hearing of oral arguments on the Federal Energy Regulatory Commission's demand response rule this week, what's next for the regulation? On today's The Cutting Edge, *Greenwire* reporter Hannah Northey discusses the impact of yesterday's hearing on the commission and future rulemakings.

Your company's statement regarding the use of defeat devices in new Euro 5 and Euro 6 diesel or gasoline direct injection vehicles of all of your company's brands

Deadline for comments: Friday, 25 September 2015 – to be re ceived by us by 3 p.m.

Dear Mr Stadler,

Since 13 October 2004, the Deutsche Umwelthilfe e.V., (German Environmental Aid Association, DUH), Fritz-Reichle-Ring 4, 78315 Radolfzell, has been registered in the list of qualified entities under § 4 of the Act on Applications for an Injunction, effective as of 11 October 2004.

The DUH is, therefore, able to prevent violations of the law against unfair competition and other consumer protection laws by taking appropriate measures of collective redress. For years, it has concerned itself with – as you know – the reduction of toxic emissions from combustion and, in this case in particular, diesel engines.

Within the framework of our education campaign "Diesel exhaust fumes kill" initiated in Frankfurt last Thursday – at the same time as the o pening of the IAA by Dr Merkel – we have referred to our own measurements as well as to investigations of the ICCT and our European umbrella association T&E. According to the investigations that you are also familiar with, in real operation Euro 6 diesel cars demonstrate similarly extremely elevated NOx/NO2 values as those involved in the current investigations of the CalEPA and the EPA in Washington concerning VW and Audi models (cf. indictment sent to VW and Audi on 18 September 2015).

Deutsche Umwelthilfe e.V.
Bundesgeschäftsführer: Jürgen Resch, Sascha Müller-Kraenner

IBAN: DE45 3702 0500 0008 1900 02 | BIC: BFSWDE33XXX

Die Deutsche Umwelthilfe e.V. ist als gemeinnützig anerkannt. Die Jahresabschlüsse unterliegen der freiwilligen Kontrolle durch ein unabhängiges Wirtschaftsprüfungsunternehmen.

Article 5 of Regulation (EC) No. 715/2007 states:

Requirements and tests

(1) The manufacturer shall equip vehicles so that the components likely to affect emissions are designed, constructed and assembled so as to enable the vehicle, in normal use, to comply with this Regulation and its implementing measures.
(2) The use of defeat devices that reduce the effectiveness of emission control systems shall be prohibited.

The DUH is in possession of indications that the vehicles of your company obviously also exhibit NO_2 values that are many times higher than expected and which cannot be explained by normal variations between the test roll and on-road operation and which point to the presence of "test cycle recognition" and/or defeat devices or, under certain operating conditions, do not function correctly.

I urge you to answer the following questions Friday, 25 September 2015, submitting them to us no later than by 3 p.m. They relate to all the brands you are responsible for and all their models of Euro 5 and Euro 6 stages of all fuels (esp. diesel engines and gasoline direct injection engines):

1. Which models recognise test situations via the f actory-provided operating software and then change the impact of the emission reduction device and switch to another map with increased emission values? Please explain in brief the nature and intensity.
2. What are the parameters that cause these vehicle s to recognise the test situation? (E.g. ambient temperature > 30 degrees, accelerometer, steering wheel position, velocity pattern of the test cycles on file etc.)
3. Is the supply of keratin in vehicles with SCR sy stems above or below a certain ambient temperature – except during a cold start – ge nerally or in combination with other parameters inhibited or throttled?
4. Which diesel models that have SCR that are appro ved for the European market switch off urea injection at speeds above 120 km/h (or higher/lower) (please quote the velocity as of which the respective model throttles or stops the injection of urea)
5. In the event that, with diesel models equipped w ith SCR, the urea tank drops below a minimum level:
   - do the OBD always automatically point out to the driver in good time that he needs to fill the tank up or is no notification given?
   - does this lead (with an empty or nearly empty tank) to the statutory emergency operation or does the operating software just regulate the urea injection in the SCR system without any error message in the OBD?

VW FOIA, EPA 06/20/2017 2017-FFP_034435

Deutsche Umwelthilfe

6. Please inform us of the results of the RDE value s for Euro 6 diesel cars models that you currently have at hand.
7. With respect to the measurement of fuel consumpt ion and CO2 emissions, which car models have the operating software that recognises the test mode?

We wish to remind you that the DUH intends to undertake selective measurements on the production vehicles already on the market in order to verify your details. We will take legal action in response to any wrong answers or non-responses (which we regard as on a par with wrong answers) and also inform the public and the supervisory authorities.

In this respect, we call on you to provide a full statement by the due date and time. The dramatic damage to the credibility of Volkswagen AG as a result the continuous misinformation of American government agencies by Volkswagen and Audi that went on for over a year is a cautionary example.

Yours sincerely,

Jürgen Resch

Federal Chairman

According to the investigations that you are also familiar with, in real operation Euro 6 diesel cars demonstrate similarly extremely elevated NOx/NO2 values as those involved in the current investigations of the CalEPA and the EPA in Washington concerning VW and Audi models (cf. indictment sent to VW and Audi on 18 September 2015).

Die Deutsche Umwelthilfe e.V. ist als gemeinnützig anerkannt. Die Jahresabschlüsse unterliegen der freiwilligen Kontrolle durch ein unabhängiges Wirtschaftsprüfungsunternehmen.

Article 5 of Regulation (EC) No. 715/2007 states:

Requirements and tests

(1) The manufacturer shall equip vehicles so that the components likely to affect emissions are designed, constructed and assembled so as to enable the vehicle, in normal use, to comply with this Regulation and its implementing measures.
(2) The use of defeat devices that reduce the effectiveness of emission control systems shall be prohibited.

The DUH is in possession of indications that the vehicles of your company obviously also exhibit NO_2 values that are many times higher than expected and which cannot be explained by normal variations between the test roll and on-road operation and which point to the presence of "test cycle recognition" and/or defeat devices or, under certain operating conditions, do not function correctly.

I urge you to answer the following questions Friday, 25 September 2015, submitting them to us no later than by 3 p.m. They relate to all the brands you are responsible for and all their models of Euro 5 and Euro 6 stages of all fuels (esp. diesel engines and gasoline direct injection engines):

1. Which models recognise test situations via the f actory-provided operating software and then change the impact of the emission reduction device and switch to another map with increased emission values? Please explain in brief the nature and intensity.
2. What are the parameters that cause these vehicle s to recognise the test situation? (E.g. ambient temperature > 30 degrees, accelerometer, steering wheel position, velocity pattern of the test cycles on file etc.)
3. Is the supply of keratin in vehicles with SCR sy stems above or below a certain ambient temperature – except during a cold start – ge nerally or in combination with other parameters inhibited or throttled?
4. Which diesel models that have SCR that are appro ved for the European market switch off urea injection at speeds above 120 km/h (or higher/lower) (please quote the velocity as of which the respective model throttles or stops the injection of urea)
5. In the event that, with diesel models equipped w ith SCR, the urea tank drops below a minimum level:
   - do the OBD always automatically point out to the driver in good time that he needs to fill the tank up or is no notification given?
   - does this lead (with an empty or nearly empty tank) to the statutory emergency operation or does the operating software just regulate the urea injection in the SCR system without any error message in the OBD?

VW FOIA, EPA 06/20/2017 2017-FFP_034444

Deutsche Umwelthilfe

6. Please inform us of the results of the RDE value s for Euro 6 diesel cars models that you currently have at hand.
7. With respect to the measurement of fuel consumpt ion and CO2 emissions, which car models have the operating software that recognises the test mode?

We wish to remind you that the DUH intends to undertake selective measurements on the production vehicles already on the market in order to verify your details. We will take legal action in response to any wrong answers or non-responses (which we regard as on a par with wrong answers) and also inform the public and the supervisory authorities.

In this respect, we call on you to provide a full statement by the due date and time. The dramatic damage to the credibility of Volkswagen AG as a result the continuous misinformation of American government agencies by Volkswagen and Audi that went on for over a year is a cautionary example.

Yours sincerely,

Jürgen Resch

Berlin, 21 September 2015

Your company's statement regarding the use of defeat devices in new Euro 5 and Euro 6 diesel or gasoline direct injection vehicles of all of your company's brands

Deadline for comments: Friday, 25 September 2015 – to be re ceived by us by 3 p.m.

Dear Mr Stadler,

Since 13 October 2004, the Deutsche Umwelthilfe e.V., (German Environmental Aid Association, DUH), Fritz-Reichle-Ring 4, 78315 Radolfzell, has been registered in the list of qualified entities under § 4 of the Act on Applications for an Injunction, effective as of 11 October 2004.

The DUH is, therefore, able to prevent violations of the law against unfair competition and other consumer protection laws by taking appropriate measures of collective redress. For years, it has concerned itself with – as you know – the reduction of toxic emissions from combustion and, in this case in particular, diesel engines.

Within the framework of our education campaign "Diesel exhaust fumes kill" initiated in Frankfurt last Thursday – at the same time as the o pening of the IAA by Dr Merkel – we have referred to our own measurements as well as to investigations of the ICCT and our European umbrella association T&E. According to the investigations that you are also familiar with, in real operation Euro 6 diesel cars demonstrate similarly extremely elevated NOx/NO2 values as those involved in the current investigations of the CalEPA and the EPA in Washington concerning VW and Audi models (cf. indictment sent to VW and Audi on 18 September 2015).

Thanks for the heads-up, Evan. FYI, it appears that DUH (aside from having an unfortunate acronym in English) is an "environmental and suit legitimate consumer association" and not a German government agency. The text below was taken from the following link using Google Translate, and the requester is mentioned in the final paragraph.

I would appreciate your keeping me looped in on any OECA response and future correspondence so that I can keep track.

Thanks again...

Anna

German Environmental Aid: strong for nature and the environment

The German Environmental Aid Association provides a forum for environmental organizations, policy and decision makers from the business world. Our goal is environmental and sustainable decisions. In dialogue with business and environmental politicians, we develop opportunities for sustainable farming practices and environmentally friendly products. At the same time we inform the public. We make environmental policy and law transparent. Critical citizens, environmental and health-conscious consumers and the media are important partners. Together we are committed to a careful use of natural resources, biodiversity and landscape.

In 1975, the German Environmental Aid Association was founded. We are an environmental and suit legitimate consumer association. Our work is financed by private donations and public grants for nature conservation and environmental protection.

National Chairman of the DUH is Prof. Dr. Harald Kächele. Approximately 80 full-time employees work in the office in Radolfzell, in our Berlin office, in the office and in the North Elbe Project office in Köthen for nature and environmental protection. Federal managers are Jürgen Resch and Sascha Müller-Kraenner

Subject: EPA Proposal Submissions
EPA_proposal_airquality_V9.docx
EPA-G2014-STAR-K1_Final.docx

Byron,

The following summarizes our EPA proposal submissions since 2011. The highlighted entries were for mobile vehicle air quality/emissions platforms. These submissions were all made to National Center for Environmental Research (NCER).

- Feb 22nd, 2011 => Developing the Next Generation Air Quality Measurement Technology / EPA-G2011-STAR-B1

- May 3rd, 2012 => Anthropogenic Influences on Organic Aerosol Formation and Regional Climate Implications / EPA-G2012-STAR-D1

- March 14th, 2014 => Modeling and Assessment of Air Quality Impacts Particulate Matter Emissions Linked to Shale Gas Extraction and Utilization / EPA-G2014-STAR-G2

- Oct 7th, 2014 => Development of a Mobile Air Quality Sensor Network System - AirCom, Pollution Monitoring for Communities / EPA-G2014-STAR-K1

Please note that we were simply replying to a question as to why we hadn't conducted a larger number of experiments with these mobile platforms. We understand the nature of funding, and the associated review processes. I am not certain that these are, however, understood by most media. Again, I cannot express our appreciation of the EPA and ARB public recognition of our work.

Thanks,
Dan

ABSTRACT

Funding Opportunity Title/Number: Developing the Next Generation Air Quality Measurement Technology / EPA-G2011-STAR-B1
Center: Center for Alternative Fuels, Engines and Emissions (CAFEE)
Center Director: Daniel Carder
Title: Mobile Platform Air Quality Measurement and Monitoring System
Investigators: Daniel Carder (PI), John Nuszkowski (Co-PI), and Mridul Gautam (Co-PI)
Institution: West Virginia University, Morgantown, WV 26506
Project Period: 3 years : 08/22/11 – 08/22-14
Project Location: Morgantown, WV – Los Angeles, CA
Project Cost (Direct/Indirect): Year 1: $280,243/$27,363 Year 2: $77,842/$20,339
Year 3: $74,358/$19,333

Objective
The objectives of the study are 1) to improve air pollution measurement technologies 2) to address emerging air pollution issues and improve the spatial and temporal coverage of air pollution measurement data.

Approach
The proposed study will validate and demonstrate a novel mobile air pollution measurement system that will integrate ambient air pollution sensors with an existing mobile weather communication network, resulting in remote, real-time transmission of air pollutant concentration data. This collaboration will leverage existing NOAA-funded research and will address the challenges of identifying geographical and temporal variations in ambient pollutant concentrations by providing mobile measurements in a variety of non-traditional locations. The central hypothesis is that by enhancing the capabilities of the available Mobile Platform Environmental Data (MoPED), currently used by the National Weather Service (NWS), and the associated advanced communication network, ambient pollutant concentration data will be provided from sensors mounted on public transportation and commercial vehicles that will enhance the spatial and temporal resolution of collected air quality data. This intricate network of mobile monitors will report real-time data, simultaneously covering larger geographical areas, and will provide corroboration and enhancement of existing EPA/State NAMS, SLAMS and SPMS.

Expected Results or Outcomes
The study will demonstrate the integration of cost-effective measurement and subsequent transfer of real-time air quality data through an existing network of ground vehicles, whose quantity is rapidly growing and expanding in geographic coverage. Additionally, the study proposes to identify miniature sensor technology, suitable for such mobile implementation, and establish methods to validate and verify the accuracy of future sensor deployment towards detection of criteria pollutants at lower concentrations.

Supplemental Keywords
Sensor network, mobile platform, communication, miniature air quality sensors, mesoscale observation network

1 RESEARCH PLAN

Measurement of criteria air pollutants and hazardous air pollutants over a larger spatial variation is vital for designing and implementing ambient air quality improvement programs. Mobile platform real-time air quality measurement and monitoring stations can be used to address certain approximations of data generated from stationary ambient air monitoring stations. **Mo**bile **P**latform **A**ir **Q**uality **M**easurement & **M**onitoring **S**ystem (MoPAQ MMS) is a proposed validation and demonstration project that uses a network of vehicles with emission-measuring sensors installed onboard that collect air quality data as they move along their destined operating routes.

The central hypothesis being tested in this proposed study is to demonstrate that MoPAQ MMS can effectively acquire and deliver air pollution data in near real time at a spatial and temporal resolution that improves the availability of air pollution measurement data and extends the air quality monitoring network to be capable of meeting emerging air pollution issues.

1.1 Objectives

a) The primary objective of MoPAQ MMS is to utilize the available mobile weather platform, with its integrated communication network as a platform to establish a network of sensors dedicated to monitoring and measuring ambient air quality. The installation of air pollutant sensing devices on a network of public transportation vehicles would provide a sensor network system capable of reporting real-time air quality information at greater spatial resolution.

EPA has formed three main monitoring station types namely National Air Monitoring Station (NAMS), State and Local Air Monitoring Station (SLAMS) and the Special Purpose Monitoring Station (SPMS). Current monitoring stations report data that is representative of a certain spatial region and hence could be biased towards the location of the monitoring station. Although most monitoring stations are aimed at spatially representing air quality information pertaining to a high population density urban area, pollutant concentrations over a higher spatial resolution is required to better address multi sources of pollutants within the confines of a single air monitoring station.

A monitoring network capable of reporting real-time criteria pollutant concentration at short spatial intervals would better support the current NAMS networks. Mobile air monitoring networks have been identified as an option to support stationary sites. However, lack of infrastructure and high costs involved in developing a large mobile network has deterred monitoring agencies from deploying them extensively. The MoPAQ MMS proposed in this study would demonstrate a mobile platform, utilizing existing resources of communication and a network of transportation vehicles. Miniature low-cost sensors integrated on mobile platform would serve as mobile air monitoring stations. MoPAQ MMS is affordable as it leverages the existing Mobile Platform Environmental Data (MoPED) communication system funded by the National Atmospheric and Oceanic Administration (NOAA) and National Weather Service (NWS) that is used for extending our nation's weather observation network. MoPAQ will use MoPED's existing mobile platform assets and system that would provide a proven real-time data

acquisition and delivery methodology. Emissions-measuring sensors will be added to the existing MoPED environmental data sensor configuration (sensor platform) creating a multi-purpose observation network of weather and air quality. By utilizing an existing weather network system, WVU proposes the MoPAQ MMS to be a cost effective technology to address spatial and temporal variations in air pollutant concentrations. The data from MoPAQ MMS would supplement current stationary monitoring stations, with better spatial resolution and help identify hot-spots of criteria pollutants within the confines of the representative area of a stationary air quality monitoring station. Initially the use of miniature low-cost sensors could pose quality assurance limitations, however future advancements in sensing technologies combined with the outcome of this network demonstration study would lay the foundation for a robust air quality monitoring network that would address complex spatial and temporal variations in pollutant concentration over a large regions of the country.

The versatility of MoPAQ MMS offers the EPA with an observation network that can evolve to address specific geographies, new standards, different instruments, and air pollutants of interest. Also, the network could bridge the spatial data void between the SLAMS (that monitor regions of interest to the state and local agencies) and the NAMS (that monitor urban regions with high population density). Not only does MoPAQ MMS provide the EPA with an observation network, but also a surveillance network that can alert authorities that certain pollutants or compounds were detected at a specific location. Figure 1 shows the data path and system layout of the proposed MoPAQ MMS.

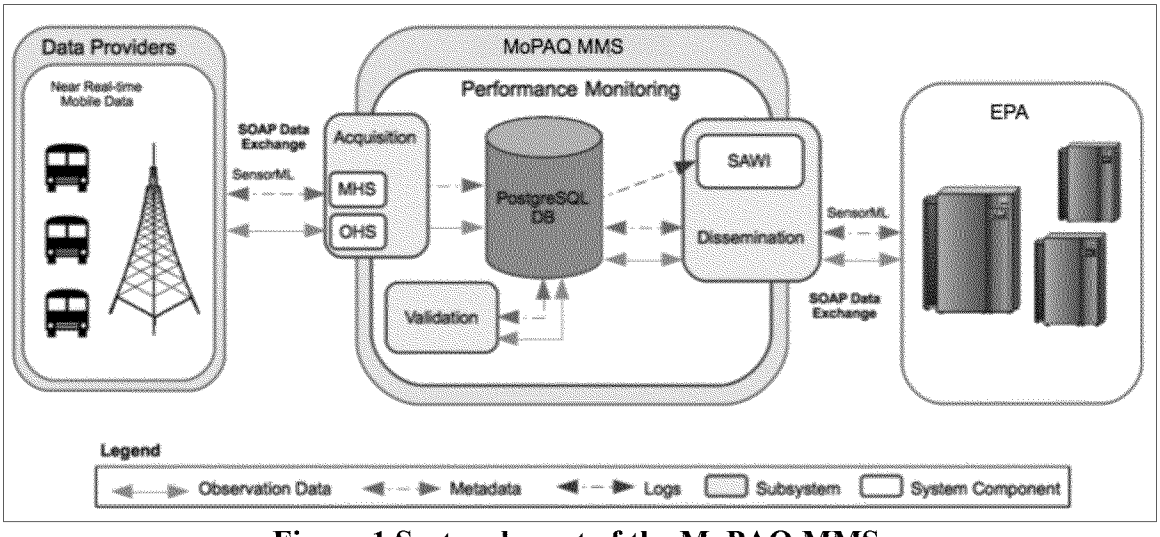

Figure 1 System layout of the MoPAQ MMS.

One of the growing concerns for regulatory agencies has been the exposure of a vast majority of the population to pollutant concentrations related to roadway sources. Roadway pollution monitoring has been particularly difficult due to the considerations of appropriate placement of monitoring stations to accurately capture the pollutant concentration levels at near roadways distance. Also, many of the health effects studies, related to near roadway pollution sources have focused on highway traffic. However, there is considerable lack of information related to roadways emissions in an urban scenario characterized by large traffic volumes and frequent stop-and-go operations. Space requirements of stationary monitoring stations pose a challenge in placement of adequate near-roadways pollution measurement sites to address the contribution of

roadways emissions to urban air quality. The MoPAQ MMS could serve as tool in effectively reporting roadways pollutant concentration, especially in an urban scenario. The network of ground vehicles moving through the traffic would report real-time pollutant concentrations at regular spatial and temporal intervals. Meteorological data combined with air quality information along the measurement routes could enhance the scope for efficient air quality modeling and better understanding of health effects.

b) The secondary objective of the study is to identify compact, high-sensitivity sensor technologies capable of forming the basis of future ambient air quality measurement network. The identification of sensors would be followed by a detailed investigation of possible factors influencing air quality measurements through a mobile platform.

The implementation of the Clean Air Act required EPA to set National Ambient Air Quality Standards (NAAQS) for six criteria pollutants (CO, NO_2, O_3, SO_2, Lead, PM_{10} and $PM_{2.5}$). These were further divided into a primary and a secondary standard, where the first is intended to protect the public health, including the health of "sensitive" populations (children, elderly, asthmatics, etc.) and the latter to protect the public welfare (damage to environment, animals, crops, buildings, etc.) [1]. Title 40, subpart 50 of the Code of Federal Regulations (CFR) describes maximum pollutant levels, measurement as well as calibration methods [2]. Conventional air quality monitoring, under these regulations, is performed using Ultraviolet Fluorescence or Pararosaniline methods for SO_2, NDIR methods for CO, Chemiluminescence methods for NO_2 and high-volume sampling methods for PM, all of them being labor and cost intensive to operate and requiring considerable amount of space; hence, are limited to stationary measurement stations [2, 3]. However, long term needs for air quality monitoring, especially for mobile applications, include compact, real time, high sensitivity sensors with low power consumption and wireless communication capabilities.

State-of-the- art micro-sensors are dominated by a variety of solid state semiconductor oxides, detecting gases based on a change in electrical resistance of a porous sensing body, and miniaturize electrochemical cells [4] that produce an electrical signal proportional to the gas concentration based on chemical reactions between the gas of interest and an electrode. Although, these types of micro-sensors can be produced on a mass basis at low costs, their application to air quality monitoring is currently limited due to lack of accuracy, sensibility as well as reliability [5]. Depending on the production method, the baseline resistance of SnO_2 based metal oxide sensors is reported to vary by up to a factor of 5 with a typical sensitivity spread between a factor of 2 to 8, depending on the target gases [6]; hence, individual calibration of each sensor would be necessary. Furthermore, current metal oxide type sensors are affected by changes in temperature, humidity and the presence of interfering gases [6] and therefore need integrated compensation algorithms. Electrochemical type sensors on the other hand are minimally affected by pressure changes, however, are quite sensitive to temperature variations [4]. Recent research has focused on Tungsten-Trioxide (WO_3) materials [5, 7], among others, since they showed particularly large resistance-increase signals in response to low concentrations of oxidizing gases such as O_3 and NO_2 and didn't exhibit SO_2 poisoning and surface hydration-dehydration effects frequently experienced with SnO_2 materials [7]. A month long comparison between reference instruments and WO_3 based semiconductor sensors reported stable measurements results for NO_2 and O_3 at atmospheric levels without recalibration [7]. There is

however, only a very limited amount of actual in-field studies reporting correlations between newly developed micro gas-sensors and EPA certified reference methods in terms of sensitivity and long-term accuracy. Moreover, the majority of sensor technologies discussed, capable of measuring pollutants at atmospheric levels (ppb) as required by the NAAQS, are still in development state and not yet commercially available [5].

While the aforementioned technologies represent a major step forward, current materials advances represent a potential leap forward in sensing capabilities. Graphene (i.e., films comprised of one to several atomic carbon layers) is among those materials showing great promise in the area. Because of its high carrier mobility, low carrier densities, and low noise levels graphene provides the basis for high speed and high sensitivity gas and liquid species sensors. As an example of both the sensitivity and low noise level of graphene based sensors, Schedin et al. [8] have demonstrated the detection of individual gas molecules adsorbed on graphene. Despite the huge opportunity provided by graphene based sensors, there are significant materials and technology barriers which must be overcome. First and foremost, large area graphene films (wafer scale) are required for the production of the sensor platform. Second, methods controlling sensor selectivity / specificity must be established. Third, in addition to the usual inorganic gas species (e.g., SO_2, NO_2, CO, CO_2, NH_3, and O_3), it is highly desirable to have sensors which can identify the hydrocarbon species which either coat or comprise environmental particulate matter. Research at West Virginia University (WVU) is presently focused on these three key areas has already demonstrated the feasibility of producing large area graphene films on 6H-SiC using halogen based plasma etching methods [9, 10]. Two methods of achieving target specificity with graphene films are being explored. In the first approach, arrays of electrically readable graphene areas on the sensor platform will each be coated with metal nano-dots (or a porous nano thin metal film). When a gas adsorbs on the metal, the carrier density (i.e., the doping level) of the graphene will be altered, and this change can be detected electrically. Because gases adsorb differently on different metals, arrays coated with different metals will provide a response indicative of the specific gas. The second approach to achieving target specificity involves functionalization of the graphene with target specific receptor molecules. When a target molecule binds to its receptor, changes in electron charge distribution of the complex will alter the doping level of the graphene. As before, this change can be detected electrically and represents the sensor response. This approach is particularly useful for organic molecules which either coat or comprise environmental particulate matter.

Additional to gaseous pollutants, the NAAQS also limits the PM_{10} and $PM_{2.5}$ mass based concentrations, averaged over a 24-hr and annual period. Current EPA reference methods include high-volume sampling with subsequent gravimetric analysis, Beta Attenuation Monitor (BAM), Tapered Element Oscillating Microbalance (TEOM™) and Nephelometer. These methods however are, similar to the gaseous reference methods, labor and cost intensive, require bulky instruments and need in case of gravimetric and BAM methods frequent change of sampling filters or tape, respectively. The TEOM method requires a stable instrument setup which, in case of mobile application, would involve an elaborate construction to dampen any vibrations caused by the moving sampling platform. Moreover, recent health studies showed evidence that PM exposure on time scales of less than a few hours can lead to adverse health effects, especially for "sensitive" groups of the population [11]. However, current ambient PM sampling methods operate on multiple hour averages; hence, are not able to account for short-

term PM variations. The most promising instruments to date for real-time PM mass concentration measurements at atmospheric levels are based on light scattering technology, which continuously measures the amount of scattered light due to particles flowing through a sensing zone. These measurements can further be related to particle concentration using the well-established light scattering theory derived by Kerker et al. (1969) [11]. The primary limiting factor for optical PM mass instruments arises from the fact that they are typically not capable of measuring particles less than approximately 0.2μm in diameter and are therefore not able to account for a significant amount of particles related to primary engine combustion emissions (≤ 0.1μm). Additionally, instrument specific sample preparation methods (dilution, heating) may volatilize organic PM prior to measurement; hence underestimating the amount of volatile and semi-volatile compounds that may account for a considerable amount of combustion derived PM [12]. Currently, there exist several commercially available instruments, sensitive to particles between 0.1 and 10μm and often possible to be equipped with different cut-size cyclones to distinguish between TPM, PM_{10} and $PM_{2.5}$. Furthermore, a new in-line, real-time PM sensor, based on the escaping current principle, is being tested at WVU and can be calibrated for mass or particle number concentration measurements. The sensor, designed for after-treatment control or On-Board-Diagnostics (OBD) application, showed good correlation with other proven lab grade aerosol measurement instruments as well as high sensitivity even downstream of a Diesel particulate filter (DPF) [13]; hence, demonstrates promising capabilities of measuring PM mass at ambient levels.

2 Approach/Activities

WVU proposes to instrument a fleet of transportation vehicles participating in the existing MoPED weather monitoring system with air pollution measurement sensors. The MoPED data acquisition system and can be extended from its current configuration to include other inputs in the form of emissions measurement sensors. For the purpose of demonstration of the technology WVU proposes to choose a sensor that has proven to be reliable, cost-effective and accurate in measuring pollutant concentrations at ambient levels and fit a network of transportation vehicles with these devices. The measurement platform would transmit data at configured intervals, through GSM cellular communication, back to the data processing center. In the event of a loss of cellular reception, data would be cached by the system and dispatched once communication has been re-established.

The primary tasks of the study can be laid out as follows:

Task 1: Sensor Identification.
Sensor identification for incorporation into the mobile platform would constitute to be the primary task. From preliminary research into miniature sensor technologies, it has been found that with the exception of carbon-monoxide and carbon-dioxide sensors, measurement of other criteria pollutants through micro sensors pose significant challenges with respect to detection limits, accuracy and variability. Hence, WVU would identify a sensor, which is capable of clearly demonstrating the goals of the study.

Task 1.1: Sensor Calibration and Validation.
This subtask will comprise of extensive testing of the identified sensor, at WVU's Engines and

Emissions Research Laboratory (EERL) against well calibrated laboratory grade analyzers, as described by EPA's reference methods, to assess measurement accuracy, zero and span drift and long time stability at low pollutant concentrations. Furthermore, standardized calibration procedures for the selected sensors will be developed.

Task 2: Wind-Tunnel Testing for Validating Sensor Positioning.
The effect of sensor location on the measurement values needs to be studied to frame guidelines for mobile air quality measurements. The fact that the mobile platform is going to be subject the effects of the measurement sensor moving through the exhaust plume of other vehicles should be considered while placement of sensors. WVU is currently developing a wind tunnel for the purpose of studying the dynamic mixing of exhaust gas plume of a heavy-duty truck. This wind tunnel would be capable of simulating wind speeds of about 55 MPH. WVU proposes to use this setup to study the dynamics of air flow around the vehicle to decide the placement and the number of sensors to be installed on the mobile platform, that would result in the most accurate method of measuring ambient pollutant concentration, without the effect of immediate sources.

Task 3: Identification of Region of Interest for Mobile Platform Vehicle Network.
WVU proposes to choose two regions with a network of existing mobile weather platforms, to demonstrate this project. The metropolitan statistical areas (MSA) of Los Angeles-Long Beach-Santa Ana and Riverside-San Bernardino-Ontario, with an estimated total population of 15.5 millions (based on 2000 U.S. Census), were identified as viable areas. Both MSA's fall under the jurisdictional boundary of the South Coast Air Quality Management District (AQMD) who operates up to 41 air monitoring stations (as of July 2010) as well as a Mobile Monitoring Station (MMS) [14], making it best suitable for this project since the number of monitoring stations well exceeds the minimum requirement as mandated by EPA. The vehicle routes would encompass urban and highway regions to demonstrate the spatial and temporal variation in pollution concentration.

Task 4: Installation of Sensors on Mobile Platform.
Sensor installation will involve the placement of the sensor on a network of transportation vehicles and integrate with the communication system of the existing mobile weather monitoring system.

Task 5: Demonstration of MoPAQ MMS Air Quality Measurement Technology.
Task of demonstration of the MoPAQ system, will include data acquisition from the network of mobile platforms, to the central database. This task would involve the comparison of MoPAQ observation data with AQMD operated ambient monitoring stations for data validation purposes. The AQMD operated measurement stations will serve as reference observation data to the MoPAQ MMS data.

Task 5.1: Validation of MoPAQ Observation through AQMD Stationary and Mobile Measurement Stations.
Air quality data collected by AQMD within the boundaries of the MoPAQ sensor network will serve as a data quality indicator of the MoPAQ observation data. Due, to the conceptual nature of this study and the proposed use of miniature sensors of ambient air quality monitoring, anomalies in the data need to be verified with standard reference practices. AQMD operated

SLAMS, SPMS and the Mobile Measurement Station (MMS), will serve as tools to compare and validate the mobile platform data. The advantages of mobile measurement trailer operated by AQMD for air quality monitoring in remote locations will be used for validating mobile platform data in specific regions of interest.

Task 5.2: Performing QA/QC Procedures on Data Received from MoPAQ.
QA/QC procedures outlined in subsequent sections would be carried out to monitor sensor performance and quality of the observation data.

Task 5.3: Expansion of MoPAQ Network to other Regions of Interest.
With increasing availability of vehicle networks, MoPAQ MMS could be expanded to other regions of interest and possibly connect the spatial data void between various stationary ambient air quality monitoring stations.

2.1 Expected Results and Outcomes

This should discuss how the research results will lead to solutions to environmental problems and improve the public's ability to protect the environment and human health. A clear, concise description will help NCER and peer reviewers understand the merits of the research.

Successful implementation of this pilot project would lay the foundation for a new measurement platform to the regulatory agencies. One of the main outcomes of this study would be laying of an infrastructure for future mobile air quality measurement networks. The existing measurement and communication network could be scaled to a larger region with the potential success of this study and could result in a nationwide monitoring network, which could supplement and support stationary monitoring stations. Another, important outcome of this project would be the efficient monitoring of roadway pollution especially in urban regions, which are not adequately spatially covered by stationary monitoring stations. The real-time meteorological information together with air quality data from this project could be used for accurate air quality planning, tracking of pollutants and modeling purposes.
The current communication method could also broadcast vehicle electronic control unit parameters, to provide regulatory agencies a tool to evaluate vehicle operation depending upon the geography. Future of this study could extend towards a possible integration with automobile engine manufacturers, to incorporate control algorithms to regulate emissions while operating within the confines of pollutant hot-spot. For instance hybrid vehicles in the future could employ its electrical power to reduce emissions while operating within a region of increased pollutant concentrations.

2.2 General Project Information

Discuss other information relevant to the potential success of the project. This should include facilities, personnel expertise/experience, project schedules with associated milestones and target dates, proposed management, interactions with other institutions, etc. Applications for multi-investigator projects must identify project management and the functions of each investigator in each team and describe plans to communicate and share data.

(project schedules with associated milestoneis yet to be formed)

Facilities

West Virginia University's Center for Alternative Fuels and Engines and Emissions (CAFEE) is an internationally recognized research program in the area of vehicles, engines, emissions, and alternative fuels. CAFEE is a large research center involving over 50 faculty, staff, and graduate students, which have been conducting research specifically focused on fuels, engines, and exhaust emissions since 1990. Since its inception, this Center has conducted hundreds of research projects with total funding of over $80 million. The projects were or are currently sponsored by fuel suppliers (BP, ARCO, Chevron, Biodiesel Board, and others), engine manufacturers (Cummins, Caterpillar, Detroit Diesel, and others), vehicle manufacturers (Ford, GM, and others), Federal Government Agencies (DOE, DOT, EPA, DARPA, and others) and State Agencies (Calif. ARB, Arizona DEQ, NY DEQ, TCEQ, and others). These projects have addressed issues associated with the full spectrum of fuel, engine, and vehicle performance. Emissions are measured in accordance with the Code of Federal Regulations (CFR 40) requirements for engine certification, which is used primarily for fuels testing, certification, and verification procedures for the states of California and Texas. CAFEE houses a heavy-duty engine dynamometer and a one of a kind transportable heavy-duty chassis dynamometer facility. Emissions measurement is a complicated affair and WVU has met various challenges along the way to adapt and develop testing facilities in both laboratory and field measurement applications. The Center has developed its own analytical measurement, control, and analysis systems in order to comply with various Federal test procedures and specific test requirements. Laboratories have been designed as fully self-contained units that can be transported to remote field test sites. The Center is involved in various alternative energy sources and has been at the forefront of evaluation of various mobile hybrid systems. Throughout its history, it has been involved in targeted engineering applications in unique areas of field research

The subcontractor for this project Global Science and Technology is highly specialized company with a workforce that includes experts in domains of engineering, science, communications, and information technology. GST has a strong reputation for its meteorological expertise and is the prime contractor of the mobile platform weather monitoring system funded by National Weather Service. GST works with a leading innovator Weather Telematics to successfully establish the communication technology for the mobile weather platform.

Personnel

A flowchart of the Project Management Plan is included in **Error! Reference source not found.**. It depicts the relationships between contractual and technical chains that will be proposed under this submittal. Throughout all phases of the study, the primary contractual and technical contact will be the Project Manager, Mr. Daniel Carder. Full program oversight will also be the responsibility of the Co-Principal Investigator, thus providing necessary redundancy for management contact.

The co-investigators will provide technical consultation and management experience. Arvind Thiruvengadam and Marc Besch will serve as the daily technical contacts for the program, and

will interface directly with Dr. Gautam and Mr. Carder. They will provide on-site support as well as remote management of all mobile platform installation and operational functions.

Dr. Gregory Thompson will serve as the QC/QA officer for the program. He will hold primary responsibility for project QC/QA, and reports directly to the program manager (Dr. Gautam). As Figure 2 indicates, the QC/QA officer is independent of the functional groups that generate measurement data.

Mr. Richard Atkinson and Mr. Zac Luzader will be available for project technical support throughout the project. Both provide necessary IT support for the WVU Transportable Laboratory, from data acquisition and reduction, through system control and analytical systems instrumentation maintenance.

Mr. Thomas Spencer will provide the necessary laboratory program management, including personnel scheduling and budget oversight. Mr. Spencer will manage the activities of the WVU MAE Department Accounting Staff in order to track expenditures and apprise the principal investigators of project status. Mr. Spencer, Program Coordinator, supports the entire Center's research efforts, and is ultimately the direct manager of all clerical and technical staff.

4 Quality Assurance Statement

1. Identify the individual who will be responsible for the quality assurance (QA) and quality control (QC) aspects of the research along with a brief description of this person's functions, experience, and authority within the research organization. Describe the organization's general approach for conducting quality research. (QA is a system of management activities to ensure that a process or item is of the type and quality needed for the project. QC is a system of activities that measures the attributes and performance of a process or item against the standards defined in the project documentation to verify that they meet those stated requirements.)

4.1 Responsible Party for Program QA/QC

The National Center for Alternative Fuels, Engines and Emissions at West Virginia University is committed to implement a Quality Control/Quality Assurance (QC/QA) program to assure generation of measurement of data of the highest quality. This quality of the data will meet all the requirements of the objective. The responsibility of the QC/QA rests on one of the senior investigators (the principal investigator or the co-principal investigators) who are often designated as senior engineers on several projects. The QC/QA engineer reports directly to the Project Director/Principal Investigator who then shares the data with the Co-Principal Investigators. The prime responsibility for management and execution of the project for conducting a work assignment and the deliverables rests with the PI. The Co-PI bring in their expertise and form and integral part of the management and execution plan.

The QC/QA engineer and QC/QA officer will work with the project engineers to ensure that the daily activities are logged, calibration gases meet the stated requirements (discussed in detail), all instruments, sensors, sampling systems, and data acquisition systems are maintained and operated in accordance with the stated plan. Miniature sensors will be calibrated and calibration curves archived for future references. Before deployment of the mobile air quality platform, the sensors would be tested in controlled conditions and data verified.

The objectives of the study are 1) to improve air pollution measurement technologies 2) to address emerging air pollution issues and improve the spatial and temporal coverage of air pollution measurement data.

4.2 Project Objectives as Related to QA/QC

1. The primary objective of the project is to demonstrate the real-time data collection of ambient air pollutant concentration through sensors placed on a network of transportation vehicles. Due to the complexities and uncertainties involved in this method of ambient air sampling, a strict QA/QC procedure would be adopted to validate and provide quality data to accomplish this primary task.

4.3 Project Elements

4.3.1 Collection of New/Primary data:

Data quality objectives and acceptance criteria, characterized in terms of accuracy, precision, detection limits, completeness, and representative, will be set based upon intended uses. Since, the project involves the use of miniature and prototype sensors for sensing ambient pollutant concentrations, the QA/QC will strive to meet the QA standards prescribed for ambient air quality monitoring and methods for calibration and sampling will be based according to the procedures prescribed in 40 CFR Part 50 for the chosen criteria pollutant in this study. Daily operational readiness of individual instrumentation will be confirmed using calibration techniques, per manufacturers' recommendations, and verification of data acquisition. A minimum performance goal of 85% successful data capture will be implemented. Achievement of this goal will require vigilance on the part of field operations personnel to detect and address variations in instrumental performance in a timely manner. When issues are found during audits or when data problems are identified, the PI will be notified rapidly so that corrective action can be taken.

Stationary monitoring stations compliant with ambient air quality measurement standards would be used to provide an indication of the minimum and maximum bounds of the ambient pollutant concentrations over a spatial region. Data would be QA/QC flagged in the event of a large deviation in sensor observations from within these bounds. Subsequently, an offline analysis of the sensor data, involving the history of data received before and after the flagged time period would be analyzed to verify drift or sensor malfunction. Also, additional observations from other sensors traversing the same location would be used to determine validity of a sensor data. Based on outcomes of the Task 1 of the research activities, a timeline for sensor re-calibration and validation would be devised and implemented on all mobile platforms to maintain the accuracy of the observation data.

2. Data Management Activities

The information from the mobile platform is divided into two services, the Observation Handling Service (OHS) and the Metadata Handling Service (MHS). The MHS data is repetitive data containing the measurement platform information. Hence, the MoPAQ MMS system employs this dual data-handling service that allows metadata to be updated on demand which will vastly reduce bandwidth and Computer Processing Unit (CPU) requirements.

When an observation is transmitted by the mobile platform, the data provider receives it and initiates the processing of the data to the OHS controller. After validation of the XML schema of the data by the OHS, the data is subsequently stored in the database as an observation, linked to a mobile platform. The MHS controller works independently in a similar procedure to populate the fields of part of the meta data XML scheme.

The MoPAQ MMS database employs client-server architecture to access data. MoPAQ MMS' MySQL database is the repository for its data. The observations are stored in the database upon acceptance into the system. Once the data are stored, the database can be queried by the Dissemination subsystem.

4.4 Collection of new/primary data:

4.5 Use of Existing/Secondary Data

4.6 Method Development

The integration of additional air quality sensors into the MoPED infrastructure will require refinement in system maintenance and calibration standards. The primary focus for method development within this effort will be the determination of sensor drift and identification of measurement inaccuracies/sensor deterioration. The research team will begin with manufacturer specifications, but will conduct extensive drift studies, both within and outside of a laboratory environment. WVU CAFEE has a rich history of emissions measurement experience and the associated requirements of field calibration and maintenance. During the demonstration phase, it is anticipated that data provided from multiple sensors will be compared to one another in order to identify sensor drift or deterioration. The research team will implement a two-tier approach in order to identify/characterize/quantify outliers. First, if data are invalid due to deviation from the specified test procedure and cannot be corrected using a redundant measurement, then it will be marked as invalid and the data will be removed from the dataset. The dataset will be annotated for the known physical reason(s) for excluding the data. Secondly, if there are no known physical reasons why the data should be excluded from the dataset, the statistical significance of the disputed data will be examined. The methodology described in Schiff and D' Agostino (1996) will be employed for the dataset with a 1% significance level. It is noted that the second approach is the same methodology employed in ASTM E178-02 (2002), Section 6. Identification of a statistically significant outlier will result in the MoPAQ unit being recalled in order to perform inspection and maintenance procedures.

4.7 Development or Refinement of Models

The proposing team does not intend to employ or develop any modeling techniques under this submission. The data provided by the mobile air quality measurement platform will be used to enhance the existing air quality database, and will be integrated in a straightforward fashion. Specific modification of air inventory models in order to accommodate these mobile data has not been deemed to be within the scope of this proposed effort.

4.8 Development or Operation of Environmental Technology

4.8.1 Overall Purpose and Anticipated Impact of the Technology

The objectives of the study are two-fold: (1) to improve air pollution measurement technologies and (2) to address emerging air pollution issues and improve the spatial and temporal coverage of air pollution measurement data. The proposing team hypothesizes that enhancing the existing MoPED infrastructure with air quality sensors will result in temporal and spatial resolution improvement to the present air quality data base. This mobile network will provide data from a variety of locations without the need for multiple fixed monitoring stations. These data can be integrated with the current air quality measurements from fixed stations in order to enhance spatial and temporal resolution of air inventory models.

4.8.2 Technical and Quality Specifications

The current specifications for the MoPED system components are included below in Table 1.

Table 1 MoPED Weather Sensor Accuracy and Resolution

Parameter Monitored	Range	Accuracy	Resolution
Air Temperature	-40 to + 80 °C	± 0.2 °C over the range -15 °C to + 85 °C; ± 1.0 °C over the range -40 °C to -15 °C	0.0625 °C
Cabin Temperature	-40 to + 80 °C	± 0.2 °C over the range -15 °C to + 85 °C; ± 1.0 °C over the range -40 °C to -15 °C	0.0625 °C
Road Temperature	-40 to + 80 °C	± 0.5 °C over the range -15 °C to + 85 °C; ± 1.0 °C over the range -40 °C to -15 °C	0.02 °C
Barometric Temperature	300 to 1100 hPa (mBar)	± 0.5 hPa (mBar)	0.01 hPa (mBar)
Humidity	0 to 100% Rh	± 2% over the range 20 to 80%; ± 3% over the ranges 0 to 20% and 80 to 100%	0.04% Rh
Light Level	0 to 128000 Lux (human eye response matched)	± 10 Lux	10 Lux
Ozone Level	0 to 250 ppb	± 10%	1ppb
Rainfall		0 to 250	1

Although a significant portion of the proposed activities is the determination and implementation of optimal air quality sensors, a sample of survey sensors and associated accuracies and resolutions are included below.

Table 2 Sensor Information for Preliminary System Identification

Parameter Monitored	Range	Accuracy	Resolution	Response Time
CO2 NDIR	0 to 2000 ppm	± 10 ppm at 20ºC Operating Temp. Range -20ºC to +50ºC Humidity Range 0 to 95% RH (non-condensing)	2.5 ppm	< 40s (T_{90}) at 20ºC
CO (Electrochemical)	0 to 500 ppm	± 3.1 ppm at 20ºC Operating Temp. Range -20ºC to +50ºC Humidity Range 15 to 90% RH (non-condensing)	1 ppm	< 30 sec (T_{90})
CO (WO3 Semiconductor)	0 to 25 ppm	± 0.2 ppm at 20ºC	0.01 ppm	< 180 sec

4.8.3 Procedures for Documenting and Controlling Design Changes

4.8.4 Procedures for Documenting the Acceptability of Processes and Components

4.8.5 Proposed System Documentation Requirements

4.9 Conducting Surveys:

The activities proposed by this research team are intended to demonstrate that air quality measurement improvements can be afforded through the enhancement of an existing mobile weather data telematic system. Considering that these proposed activities are aimed at providing "proof-of-concept" for the manner in which these data may augment current air quality measurement infrastructure, a thorough investigation of survey size and scope has not been provided. Statistical techniques for determining the weighting of the proposed mobile data within the overall air inventory qualification has not been deemed to be within the scope of this proposed effort.

5 Budget and Budget Justification

5.1 Personnel

A detailed breakdown of proposed labor and fringe costs for the program is included in Table 1 on a yearly basis. Included are the position titles, annual salary, percent effort, and fringe costs associated for each effort year, as well as a summation for total program.

Table 3 Overview of Labor and Fringe Costs

5.2 Fringe Benefits

The following schedule of standardized fringe benefits rates for West Virginia University will be adhered to under the proposed program:

- Full time (Faculty and Staff) – 25%
- Part time – 7.4%
- Undergraduate Student – 1.1%
- Graduate Student (Graduate Research Assistants) – 6.6%

5.3 Travel

Travel cost estimates are included in Table 2, below, and are provided based upon previous project travel costing experience, as well as estimates obtained during the time of proposal development.

Table 4 Summary of Program Travel Estimates

			PER DIEM	AIRFARE			LODGING		
Total Days	Number of Travelers	Destination:	Total Per Diem:	Number of Travelers	Estimated Airfare	Total Airfare:	Number of Rooms:	Estimated Room	Total Lodging:
2	3	District of Columbia	$ 384.00				3	150.00	$ 900.00
3	3	California	$ 513.00	3	$450.00	$1,350.00	2	130.00	$ 780.00
3	2	California	$ 342.00	2	$450.00	$900.00	2	130.00	$ 780.00
3	2	California	$ 342.00	2	$450.00	$900.00	2	130.00	$ 780.00
2	3	District of Columbia	$ 384.00				3	150.00	$ 900.00
3	2	California	$ 342.00	2	$450.00	$900.00	2	130.00	$ 780.00
3	2	California	$ 342.00	2	$450.00	$900.00	2	130.00	$ 780.00
3	2	California	$ 342.00	2	$450.00	$900.00	2	130.00	$ 780.00
3	2	California	$ 342.00	2	$450.00	$900.00	2	130.00	$ 780.00
2	3	District of Columbia	$ 384.00				3	150.00	$ 900.00
TOTALS			$3,717.00			$6,750.00			$8,160.00

5.4 Equipment

No equipment purchases (Property > $5,000) are being proposed for this program.

5.5 Supplies

Supplies purchase estimates included herein are resultant of personal contact with vendors and prior purchase experience. These purchases are for laboratory and office supplies that are required to efficiently and successfully meet proposed goals.

5.6 Contractual

Global Science and Technology will be contracted to implement MoPED system enhancements.

5.7 Other Direct Costs

No additional direct costs are being proposed for this program.

5.8 Indirect Costs

The U.S. Department of Health and Human Services is West Virginia University and West Virginia University Research Corporation's "cognizant agency" for negotiating facilities and administration (F&A) and Fringe Benefits rates to be charged on all sponsored agreements. The F&A rate agreement approved by DHHS is appended at the end of this document. The activities proposed herein are predominantly off-campus in nature, thus these research endeavors have an applied F&A rate of 26%. It is noted that F&A Rates are only applied to the first $25,000 of any subcontract award.

Table 5 Summary of WVU Facilities & Administration Rates

Type of Sponsored Activity	Research Location	F&A Rates
Research	On-Campus	47%
	Off-Campus	26%
Instruction	On-Campus	55%
	Off-Campus	26%
Other Sponsored Activity (OSA)	On-Campus	32.50%
	Off-Campus	26%

Table 6 Summary of Program Direct and Indirect Costs

	Year 1	Year 2	Year 3	Program Totals
Total Direct Charges	$280,305.44	$77,904.44	$ 74,420.44	$ 432,630.33
Total Indirect Charges	$ 27,379.42	$20,255.16	$ 19,349.32	$ 66,983.89
Yearly Totals	$ 307,684.86	$ 98,159.60	$ 93,769.76	
		PROGRAM TOTAL		$ 499,614.22

6 Resumes

Daniel K. Carder

Interim Director
Center for Alternative Fuels, Engines and Emissions
Mechanical and Aerospace Engineering
West Virginia University

AREAS OF INTEREST

Alternative Fuels and Energy Sources, Internal Combustion Engines and Emissions, Engine Control.

I. EDUCATION

1999 M.S. Mechanical Engineering. West Virginia University, Morgantown, WV.
1992 B.S. Mechanical Engineering. West Virginia University, Morgantown, WV.

II. EMPLOYMENT HISTORY

Present	Interim Director, Center for Alternative Fuels, Engines and Emissions, West Virginia University, Morgantown, WV 26506.
1999-2010	Program Coordinator, Department of Mechanical and Aerospace Engineering, West Virginia University, Morgantown, WV 26506.
1998-1999	Engineering Scientist, Department of Mechanical and Aerospace Engineering, West Virginia University, Morgantown, WV 26506.
1992-1993	Supplemental Employee, Ford Motor Company Scientific Research Laboratory

RESEARCH EXPERIENCE

For over 15 years, Mr. Carder has specialized in the measurement of emissions from heavy-duty diesel engines and alternative fuels research at West Virginia University. He has served in the capacity of Design Engineer, Project Manager, Co-Principal Investigator, and Principal Investigator on funded research projects totaling over $70 million dollars; most of it through the Center for Alternative Fuels, Engines and Emissions (CAFEE). Project sponsors include: US Army, US DOE, United Stated Postal Service, South Coast AQMD, multiple engine manufacturers with oversight from the US EPA, Miami Dade Transit, Oak Ridge National Laboratory, ARDEC (through Imperial Machine Tool), US DOT, DHHS, CDC, NIOSH (NIH - RO1), CARB, Coordinating Research Council, State of West Virginia, and other State and Federal agencies, as well as various industrial entities. His project responsibilities have been very diverse in nature, ranging from project proposal formulation to design and proof-of concept. Mr. Carder is currently serving as Interim Director of West Virginia University's Center for Alternative Fuels Engines and Emissions.

John P. Nuszkowski, Ph.D. Research Assistant Professor
Mechanical and Aerospace Engineering
West Virginia University

AREAS OF INTEREST

Vehicle and Internal Combustion Engine Performance and Emissions, Diesel Fuel Additives, Renewable Fuels, and Emissions Formation.

I. EDUCATION

2008 Ph.D. Mechanical Engineering, West Virginia University, Morgantown, WV.
2005 M.S. Mechanical Engineering, West Virginia University, Morgantown, WV.
2003 B.S. Mechanical Engineering, Rochester Institute of Technology, Rochester, NY.

II. EMPLOYMENT HISTORY

2008-Present Research Assistant Professor, Department of Mechanical and Aerospace Engineering, West Virginia University, Morgantown, WV 26506.
2003-2008 Graduate Research Assistant, Department of Mechanical and Aerospace Engineering, West Virginia University, Morgantown, WV 26506.
2002 Controls Engineer Internship, General Electric - Power Systems, Schenectady, NY, 12345.
2002 Mechanical Engineer Internship, General Electric - Power Systems, Schenectady, NY, 12345.
2001 Mechanical Design Engineer Internship, Laerdal Medical Corporation, Wappingers Falls, NY, 12590.
2001 CAD Applications Engineer Internship, Gleason Works, Rochester, NY, 14607.
2000 Mechanical Engineer Internship, General Electric - CRD, Niskayuna, NY 12309.

IV. RELEVANT RESEARCH ACTIVITIES

- Development and evaluation of a new raw emissions laboratory for testing locomotives and marine vessels.
- Evaluation of a new chassis emissions laboratory for testing vehicles year 2007 or newer.
- Performed fundamental combustion studies of fuels and fuel additives effects on heavy-duty, on-road diesel engine emissions effects.
- Development of combustion models based on the measurement of in-cylinder pressure for diesel engines under steady state and transient operation.
- Measurement of gaseous and particulate emissions from heavy-duty on-road and off-road vehicles and equipment for atmospheric pollutant inventory modeling and prediction.

- Development and evaluation of advanced exhaust aftertreatment systems such as catalyzed particulate filters, selective catalytic reduction (SCR), and oxidation catalyst systems for diesel fueled engines.

MRIDUL GAUTAM
Associate Vice President for Research and Economic Development
and Robert C. Byrd Professor of Mechanical and Aerospace Engineering
West Virginia University
886 Chestnut Ridge Road, Morgantown, WV
304-293-5913 (Phone); (304) 293-7498 (Fax); mgautam@mail.wvu.edu

Professional Preparation:

Ph.D. Mechanical Engineering, West Virginia University, Morgantown, WV (1989)
M. Tech. Mechanical Engineering, Indian Institute of Technology, New Delhi, India (1984)
B. Tech. Mechanical Engineering, G. B. Pant Univ. of Ag. and Tech., Pantnagar, India (1982)

Appointments:

2007 - Present Interim Associate Vice-President for Research and Eco Dev, West Virginia University
1999 – Present Professor, Department of Mechanical and Aerospace Engineering, West Virginia University
2007 – Present Adjunct Professor, Department of Pediatrics, West Virginia University
1994 – 1999 Associate Professor, Department of Mechanical and Aerospace Engineering, West Virginia University
1988 – 1994 Assistant Professor, Department of Mechanical and Aerospace Engineering, West Virginia University

Administrative Responsibilities:

Work with the Vice President for Research and Economic Development. Work collaboratively with faculty, department chairs, associate deans for research and deans, focus on developing research programs with an emphasis on the broadly defined areas of science and engineering. Also, provide leadership for articulating and implementing a shared vision for research, including interdisciplinary research, and serve as a leader in addressing state and national issues of compelling interest to the research community.

Publications: Published over 400 technical reports including refereed journal articles (85), symposia/published proceedings and published abstracts of papers presented at professional meetings (over 285), invited presentations (31), and bound symposium volumes/books/book and magazine articles (11).

Grant/Contract Record: Served as PI and/or Co-PI on extramural grants or contracts from external funding agencies, including DOE, NIOSH, DoD, DOT, California ARB, Southcoast AQMD, TCEQ, engine manufacturers (Ford, Cummins, Detroit Diesel, Caterpillar, Volvo, Mack, Navistar), State of WV, and other agencies totaling more than $70M.

Five Relevant Publications:

1. Mulone, V., Cozzolini, A., Abeyratne, P., Littera, D., thiagarajan, M., Besch, M.C., Gautam, M., (2010), "Soot Modeling for Advanced Control of Diesel Engine Aftertreatment", ASME Journal of Engineering for Gas Trubine Engine and Power, *Accepted for publication.*
2. Thompson, Gregory J., Carder*, Daniel K., Clark, Nigel N., and Gautam, M. (2009), "Summary of In-use NOx Emissions from Heavy-Duty Diesel Engines", SAE Transactions Journal of Commercial Vehicles, Vol. 1, pp 162-184, April 2009.
3. Campa, G., Thiagarajan*, M., Krishnamurthy**, M., Napolitano, M. R., Gautam, M., (2008) "A Neural Network Based Sensor Validation Scheme for Heavy-Duty Diesel Engines", ASME Journal of Dynamic Systems, Measurement and Control, Vol. 130, pp. 021008-1 to 021008-10, Vol. 130.

4. Kim, Dong-Hee, Gautam, M., and Gera, D., (2002), "Parametric Studies on the Formation of Diesel Particulate Matter", Journal of Aerosol Science, Vol 33, pp. 1609-1621.
5. Kim, Dong-Hee, Gautam, M., and Gera, D., (2001) "On the Prediction of Concentration Variations in a Dispersing Heavy-duty Truck Exhaust Plume Using k-ε Turbulent Closure", Atmospheric Environment, Vol. 35, pp. 5267 – 5275.

Five Additional Publications in the area Computational Fluids and Thermal Sciences:

1. Salem, M.I., Mucino, V.H., Saunders, E., Lozano-Guzman, A., and Gautam, M., (2009), "Lateral Sloshing in Partially Filled Elliptical Tanker Truck Using a Trammel Pendulum", International Journal of Vehicle Systems, Vol. 16, No. 1/2, pp. 207-224.
2. Gera, D., Gautam, M., Gangarao, H.V.S., (1997), "Wave Growth Patterns in a Non-Linear Dispersive System with Instability and Dissipation", Int'l J. Mathematics and Mathematical Sciences, Vol. 20, No. 3, pp. 599-604.
3. Gera, D. and Gautam, M., (1995), "A Short Note on the Measurement of Gas Throughflow Velocity", Transactions of Institution of Chemical Engineers, Vol. 74, Part A, pp. 137-138 (with commentary by Prof. J.F. Davidson).
4. Kar, K., and Gautam, M., (1995), "Orientation Bias of the Isolated 10-mm Nylon Cyclone at Low Stream Velocity", American Industrial Hygiene Association Journal, Vol. 56, pp. 1090-1098 (Best Aerosol Paper – Internationally awarded)
5. Gera, D., and Gautam, M., (1995), "Bubble Rise Velocity in Two-Dimensional Fluidized Beds", Powder Technology, Vol. 84, No. 3, pp. 283-285.

Synergistic Activities:

1. Member of the Statewide Cyberinfrastructure (CI) Planning Group to help define long-term goals for the expanded use of CI in academic research, and develop a CI Strategic Plan for the state. The CI Plan will serve as an extension to *Vision 2015*, the Statewide Science and Technology Strategic Plan.
2. One of the principal authors of *Advanced Energy Initiative,* the Strategic Plan for Energy Research, Education and Development at West Virginia University in 2008.
3. Principal founding member and Co-Director of the Center for Alternative Fuels, Engines and Emissions (CAFEE) at WVU, and play a leadership role in the initiation, development, and execution of CAFEE's research programs
4. Principal founding member, and Co-Director or the Center for Advanced Research in Autonomous Technologies at WVU. Current effort involves development of novel propulsion systems, and CFD-based design and analysis of micro-aerial vehicles.
5. Awards: Licensing Agreement with SKC, Inc.-"GS Cyclone", the Gautam-Sreenath Multi-inlet respirable dust personal cyclone sampler; Outstanding Aerosol Paper Award-AIHA and ACGIH; Ralph R. Teetor Educational Award-SAE; Robert C. Byrd Professor of Mechanical and Aerospace Engineering, WVU; The Researcher of the Year, College of Engineering and Mineral Resources, WVU, 2006, 2002, 1999, 1995; Outstanding Researcher of the Year, College of Engineering and Mineral Resources, WVU, 2006, 2005, 2003, 2002, 2000, 1999, 1997, 1996, 1995, 1994, 1993, 1991; Outstanding Teacher, College of Engineering and Mineral Resources, WVU, 1998. Outstanding Young Researcher of the Year, College of Engineering, WVU, 1990.

Current Collaborators:

Alberto Ayala, Curt Peterson, Wade Huebsch, Nigel Clark, Benjamin Shade, Victor Mucino, Leon Manole

Dissertation and Theses Advisees:

Supervised 21 and graduated 17 doctoral students; Supervised 55 and graduated 51 Masters students

AREAS OF INTEREST

Program Management, Systems Engineering, Instrumentation, Electric and Hybrid Electric Vehicles.

I. EDUCATION

1995 M.S. Electrical Engineering. West Virginia University, Morgantown, WV.
1993 B.S. Electrical Engineering. West Virginia University, Morgantown, WV.

II. EMPLOYMENT HISTORY

2000-Present Program Coordinator, Department of Mechanical and Aerospace Engineering, West Virginia University, Morgantown, WV 26506.

1996-2000 Engineering Scientist, Department of Mechanical and Aerospace Engineering, West Virginia University, Morgantown, WV 26506.

1994-1996 Research Associate, Department of Mechanical and Aerospace Engineering, West Virginia University, Morgantown, WV 26506.

1993-1994 Teaching Assistant, Department of Electrical and Computer Engineering, West Virginia University, Morgantown, WV 26506.

III. RELEVANT RESEARCH & PROGRAM MANAGEMENT ACTIVITIES

- Management of all CAFEE facilities, laboratories, support staff and accountants
- Serve as CAFEE's internal financial lead
- Coordinate the hiring of laboratory staff, temporary workers and student hourlys
- Assist in the writing of grant proposals and publications
- Serve as technical lead in the development of laboratory SOP documentation
- Develop and review laboratory quality control and assurance documentation
- Serve as laboratory safety lead and primary emergency contact
- Management of EERL personnel to meet project deliverables and timelines
- Gas Chromatography system and method development/testing
  -NMHC and Hydrocarbon Speciation related to California (CARB) and Texas (TCEQ) fuel certification
- Serve as technical consultant for CAFEE's 40CFR1065 laboratory development
- Design and implementation of CAFEE's 2007 Emissions mass weighing room
- Data acquisition & engine control system development and testing
- Engine dynamometer test cell operation, development and implementation of test procedures, quality assurance processes, and data quality improvement plans.

- Assisted in the development and evaluation of a new raw emissions laboratory for testing locomotives and marine vessels.
- Served as a technical consultant for the development of CAFEE's new chassis emissions laboratory for testing vehicles year 2007 or newer.
- Lead a team of students and faculty to establish WVU's initial hybrid electric vehicle program.

ARVIND THIRUVENGADAM

Department of Mechanical Aerospace Engineering
Email : arvind.thiruvengadam@mail.wvu.edu

EDUCATION:

- Currently into the PhD program in Mechanical Engineering, West Virginia University
  (Aug 2007- Present)
- Masters in Mechanical Engineering, West Virginia University
  (Aug 2004- May 2007)
- Bachelor of Engineering in Mechanical Engineering, University of Madras
  (June 2000-June2004)

RESEARCH EXPERIENCE:

Graduate Research Assistant- Center for Alternative Fuels, Engines and Emissions (CAFEE)
Dept. of Mechanical and Aerospace Engineering, WVU

Title: "Study the effect of an economical catalyst formulation on regulated, unregulated and particulate matter emissions from a CNG transit bus."
Summary: CNG fueled bus from Riverside Transit Authority; California was tested on the WVU chassis dynamometer. The study involved complete chemical speciation of exhaust with and without the catalyst to observe the effectiveness of the catalyst in reducing toxic air contaminates and regulated pollutions. Particle sizing measurements were performed using Scanning Mobility Particle Scanner (TSI SMPS- 3936) during the warm-up period of the catalyst, to observe the effect of catalyst temperature on PM number and size distribution.

Title: "Characterization of Toxicity as a Function of Volatility of Ultrafine PM Emissions from Compressed Natural Gas Vehicles"
Summary: The project involved the characterization and determination of toxicity with respect to volatility of particulate matter emissions from CNG vehicles. The project involved the chassis dynamometer testing of two 2010 compliant three-way catalyst equipped CNG transit buses. The study involved the sampling of all unregulated species and the sampling of PM as thermally denuded and non-denuded stream to further asses the toxicity impact the non-volatile portion and the complete PM emissions from these vehicles.

Title: "Study the effect of engine load and exhaust gas dilution ratio on diesel particulate morphology"
Summary: 2005 Model Daihatsu diesel engine and Isuzu C240 diesel engines, were tested on an eddy current dynamometer. Diesel particulate matter samples were obtained using Nanometer Aerosol Sampler (TSI NAS-3089). The samples were analyzed using Scanning Electron Microscope (SEM) and Atomic Force Microscopy (AFM) to establish the change in morphology and composition of the diesel particulate matter with different test conditions.

Title: "Regulated and unregulated exhaust emissions from twelve solid resource collection vehicles from the City of Los Angeles"
Summary: Project funded by the South Coast Air Quality Management District (SCAQMD, involved detailed chemical speciation of exhaust from 12 multi-fueled solid resource collection vehicles to compare the emissions from diesel, CNG and dual-fuel heavy-duty trucks. 12 trucks were tested on the chassis dynamometer part of West Virginia University heavy-duty transportable laboratory.

Title: "Particulate Matter size distribution from a DPF-SCR equipped 2010 compliant heavy-duty diesel engine operating at in-use engine load conditions"
Summary: The project involved the study particle size and number count measurements from a heavy-duty diesel engine equipped with DPF and urea based SCR system. Custom engine dynamometer test cycles with in-use engine load data were created to study the exhaust gas temperature effect on PM number emissions from advanced after-treatment systems that meet USEPA 2010 PM and NOx emissions standards.

Title: "Study the volatility of Diesel Particulate matter through Scanning Electron Microscopy and Atomic Force Microscopy analysis"

Summary: As an extension to the morphology study, work is in progress to establish a metric for volatility of diesel particulate matter through SEM analysis. The work involves the use of image processing tools to determine the change in size of volatile diesel particulate matter during SEM analysis and correlate this size change to the volatility of the diesel particles.

Assisted Projects:

"Advanced Diesel Emissions Control Systems (ADECS)"
Involved in engine dynamometer testing of ECU calibrations strategies that would help meet USEPA 2010 heavy-duty emissions limits and optimizing after-treatment strategies to meet the ECU calibrations. Project funded by SCAQMD required the conversion of 2007 MY heavy-duty diesel engine to 2010 emissions limits compliance through ECU strategies and optimized after-treatment systems. Project involved extensive gaseous emissions measurement and a detailed PM number count measurements along with morphology study.

"Effect of Dilution Methods on Diesel Particulate Matter Concentrations and Size Distributions"
Assisted with testing and data collection for a research work intended to study the effect of various dilution methods on diesel particulate matter concentrations and size distributions. The study looked into the effects of single and two stage dilutions, with hot and cold dilution air on particle size distribution.

"Certification of a 2005 Model Daihatsu Engine and Evaluation of Performance of a New Oxidation Catalyst"
Conducted the certification of a 2005 Daihatsu diesel engine for MSHA. ISO 8178 tests were conducted to study the influence of the oxidation catalyst on regulated emissions and PM size distributions and concentrations.

"Diesel Engine PM Collection on Surfactant to study the Toxic Effect of PM"
Supervised a joint project by WVU, NIOSH-Morgantown and University of Southern California (USC) aimed at collecting diesel engine PM on a surfactant solution using a particle concentrator, for toxicology studies.

"In-Use Emissions Testing and Demonstration of Retrofit Technology for Control of On-Road Heavy-Duty Engines," South Coast AQMD, Spring 2011 (dates not set), Diamond Bar, CA.

"Performance of an SCRT System on a Class-8 Tractor," South Coast AQMD, Sep. 1, 2010 - Oct. 30, 2010, Diamond Bar, CA.

"Characterization of Toxicity as a function of Volatility of Ultrafine PM Emissions from Compressed Natural Gas Vehicles," California ARB, Jan. 1, 2010 - May 1, 2010, Sacramento, CA.

"Nanoscale Catalysts for Ground Vehicle Fuel Economy Enhancement," ManTech International Corporation, Nov. 1, 2008 - Nov. 1, 2009.

"Demonstration of Advanced Diesel Emission Control System (ADECS) in Low-Sulfur Diesel-Fueled Heavy-Duty Engines," South Coast AQMD, Sep. 1, 2006 - Aug. 1, 2008, Diamond Bar, CA.

V. RELEVANT RESEARCH ACTIVITIES

Participation in emission measurement, performance and research work at the Engine & Emissions Research Laboratory (EERL) including, but not limited to following studies:

- Development and evaluation of an advanced diesel emissions control system (ADECS) for ultra low-sulfur diesel fueled heavy duty engines including design of experiment (DOE) techniques and statistical methods to optimize engine calibration as well as aftertreatment component integration targeting US 2010 HDD emission standards.
- Performance measurement of catalyzed as well as non-catalyzed diesel particulate filters.

- Performance and emissions characterization from HDD engines fueled with fuel-born catalyst additives.
- Characterization of regulated and unregulated emissions form 2010 compliant HD-CNG equipped transit busses mounted on a chassis dynamometer.
- Performance and emissions characterization from a H_2-Enriched Heavy-Duty Diesel Engine
- Effects of different gas (CNG with varying H_2 content) fuels on the engine operation with increased compression ratio on a two-cylinder gasoline research engine.

7 Current and Pending Support

8 Guidelines, Limitations, and Additional Requirements

8.1 Letters of Intent/Letters of Support

The South Coast Air Quality Management District (SCAQMD) has provided a letter of intent, and this is included on the following page. SCAQMD has agreed to provide data sharing from their mobile air quality measurement systems (MMS), as well as the State and Local Air Monitoring Stations (SLAMS) and Special Purpose Monitoring Stations (SPMS) that they operated for air quality measurements within their region.

8.2 Funding Opportunity Number

The proposing team is applying for the regular award Funding Opportunity Number (FON), **EPA-G2011-STAR-B1.**

8.3 Confidentiality

By submitting an application in response to this solicitation, the proposing team has agreed to grant the EPA permission to make limited disclosures of the application to technical reviewers both within and outside the Agency for the express purpose of assisting the Agency with evaluating the application. No claim of confidentiality for any portion of this proposal package has been made.

Mr. Daniel Carder, Director
Center for Alternative Fuels, Engines and Emissions
Department of Mechanical and Aerospace Engineering
West Virginia University
Morgantown, WV 26506

Dear Mr. Carder:

The South Coast Air Quality Management District (AQMD), as part of its mission to monitor and control air pollution and to protect the health of the residents for all of the South Coast Basin, is pleased to support West Virginia University (WVU) in their application for the EPA Funding Opportunity "Developing the Next Generation Air Quality Measurement Technology." The main thrust of this project, entitled "Mobile Platform Air Quality Measurement and Monitoring System (MoPAQ)," is the evaluation of a newly developed mobile air quality measurement system, based upon an existing miniaturized sensor network (MoPED) built for the collection of highly resolved meteorological data. These sensors will be mounted in cars and busses operating in Southern California for the purpose of creating a large network of real time data that can be used to enhance ambient air quality spatial and temporal resolution.

Since the MoPAQ's in-field performance has not been fully tested, one of the main objectives of the proposed study is to assure that the data collected by these portable devices is reliable and accurate. Therefore, AQMD would like to support this proposal by offering WVU access to AQMD monitoring network sites such that the MoPAQ can be operated at locations where the same air quality variables are measured using well established monitoring techniques. This type of comparison is important for a complete evaluation of overall MoPAQ performance.

This proposal provides a valuable opportunity for the development and demonstration of novel measurement technology that will improve the spatial and temporal coverage of air quality data that could be useful for air quality analysis by regulatory agencies.

Sincerely,

Philip Fine, Ph.D.

ABSTRACT

Funding Opportunity: Air Pollution Monitoring for Communities/EPA-G2014-STAR-K1
Title: Development of a Mobile Air Quality Sensor Network System - *AirCom*
Investigators: Arvind Thiruvengadam (PI), Daniel Carder (Co-PI), Marc C. Besch (Co-PI), and John Mejia (Co-PI)
Institution: West Virginia University, Morgantown, WV / Desert Research Institute, Reno, NV
Project Period: 3 years: 04/01/15– 03/31/18
Project Location: Morgantown, WV
Project Cost (Direct/Indirect): Year 1: $255,270/$40,093 Year 2: $121,893/$27,158
Year 3: $79,662/$9,678

Objective
The objectives of the study are 1) to improve the spatial and temporal coverage of air pollution measurement through a ***network of mobile low-cost sensors***, 2) to better understand the ***limitations, and factors affecting the quality*** of measurements provided by miniature air quality sensors, and 3) to develop an efficient strategy to communicate the ***importance of community partnership in measuring air pollution*** at high spatial and temporal resolution.
Approach
This study proposes to utilize heavy-duty vehicles as ***mobile platforms to house low-cost ambient air quality sensors*** designed at measuring criteria pollutants at high spatial and temporal resolution. The study actively seeks to engage heavy-duty trucking fleets and transit bus agencies to participate as mobile platform operators. The importance of this study lies in actively involving and transferring awareness of air quality challenges, measurement principles and technologies to community partners, thereby ensuring high quality data collection from the mobile sensor platforms. The proposed study will identify suitable sensor technologies capable of measuring criteria pollutants at ambient concentration levels. Controlled experiments will aid in sensor response model development to account for interference and influence of external factors, as well as sensor sensitivity and linearity validation. The study further proposes to use the available network of fixed monitoring stations in conjunction with pollutant dispersion modeling for in-situ sensor quality validation. One of the salient goals of this study is to ***create awareness of air quality within communities using interactive web based data dissemination tools*** providing quasi real-time air quality data measured through the mobile platforms.
Expected Results or Outcomes
The study will demonstrate the integration of cost-effective measurement and subsequent transfer of real-time air quality data through an existing network of ground vehicles. The criteria pollutants measured at high spatiotemporal resolution can potentially identify emissions hot spots, while information obtained from the mobile sensors will effectively bridge the spatial gap between fixed air monitoring stations. The study will identify real-world factors that include durability and meteorological conditions, which impair sensitivity and repeatability of miniature sensors. The sharing of air quality data through an interactive website is expected to improve the public's awareness of air quality challenges in non-attainment regions and the importance of community participation in such measurement activities. Moreover, the successful demonstration of this study can potentially lead to a larger acceptance of mobile sensor platforms for air monitoring, leading to greater geographical coverage for pollution monitoring.
Supplemental Keywords
Sensor network, mobile platform, communication, miniature air quality sensors.

1 RESEARCH PLAN

Measurement of criteria air pollutants and hazardous air pollutants over a larger spatial variation is vital for designing and implementing ambient air quality improvement programs and raise public awareness of how air quality affects communities. Traditionally, ambient air quality is being monitored through fixed measurement stations that are coarsely dispersed over an area of interest with data being used for defining regulatory road maps for pollution mitigation or dissemination to the public through web-interfaces such as EPA's AirNow (www.airnow.gov). However, air pollution modeling by Hystad et al. [1] using data from fixed monitoring stations revealed the scarcity of measurement locations near major roadways and intersections. Indeed, monitoring locations have been typically chosen in areas with reduced air pollution in order to reduce the impact of a single large point source onto the '*true*' average pollutant levels over a given region. This approach however is especially limited to understand and assess actual exposure of individuals to atmospheric pollutants on street and neighborhood levels [2].

Therefore, mobile platform based real-time air quality measurement and monitoring stations could be used to address certain shortcomings and approximations of data generated from stationary ambient air monitoring stations and provide pollutant concentrations at higher spatial and temporal resolution. *AirCom* is a proposed validation and demonstration project that uses a network of vehicles with an array of low-cost pollutant sensors installed onboard to collect air quality and meteorological data as they move along their destined operating routes.

The central hypothesis being tested in this proposed study is to demonstrate that *AirCom* can effectively acquire and deliver air pollution data in near real-time at a spatial and temporal resolution that improves the availability of air pollution measurement data and extends the air quality monitoring network to be capable of meeting emerging air pollution issues. Moreover, *AirCom* will allow communities to monitor criteria air pollutants at the neighborhood and street level enabling them to identify unhealthy areas and take necessary action. It further allows the public and especially sensitive groups to avoid these areas and modify their commuting behavior.

1.1 Objectives

a) The primary objective of *AirCom* is to improve the spatial and temporal coverage of ambient air pollution measurement through a network of mobile low-cost sensors. The installation of air pollutant sensing devices on a network of heavy-duty transportation vehicle fleets would provide a sensor network system capable of reporting real-time air quality information at greater spatial resolution.

EPA has formed three main monitoring station types namely National Air Monitoring Station (NAMS), State and Local Air Monitoring Station (SLAMS) and the Special Purpose Monitoring Station (SPMS). Current monitoring stations report data that is representative of a certain spatial region and hence could be biased towards the location of the monitoring station. Although most monitoring stations are aimed at spatially representing air quality information pertaining to a high population density urban area, pollutant concentrations over a higher spatial resolution is required to better address multi sources of pollutants within the confines of a single air monitoring station. The substantial inhomogeneities existent in urban air quality make it additionally daunting to interpret data measured by a coarse grid of fixed monitoring sites [3].

A monitoring network capable of reporting real-time criteria pollutant concentration at short

spatial intervals would better support the current NAMS networks. Mobile air monitoring networks have been identified as an option to support stationary sites. However, lack of infrastructure and high costs involved in developing a large mobile network has deterred monitoring agencies from deploying them extensively.

One of the growing concerns for regulatory agencies has been the exposure of a vast majority of the population to pollutant concentrations related to roadway sources. Roadway pollution monitoring has been particularly difficult due to the considerations of appropriate placement of monitoring stations to accurately capture the pollutant concentration levels at near roadways distance. Also, many of the health effects studies, related to near roadway pollution sources have focused on highway traffic. However, there is considerable lack of information related to roadways emissions in an urban scenario characterized by large traffic volumes and frequent stop-and-go operations. Space requirements of stationary monitoring stations pose a challenge in placement of adequate near-roadways pollution measurement sites to address the contribution of roadways emissions to urban air quality.

The emergence of new sensing technologies that are of small size, capable of broadcasting real-time response readings and which can be produced at low cost is currently leading to a paradigm shift in ambient air monitoring away from government dominated air quality assessment with lab-grade fixed monitoring sites to more community involvement using large quantities of '*lower quality*' data at significantly increased temporal and spatial resolution [1, 2, 3]. Miniature sensors carried by citizens can communicate in real-time with central data-processing servers and act as dispersed continuous monitors able of capturing time-varying criteria air pollutants [1]. In theory this would allow to instantaneously deliver high-resolution spatiotemporal data [1]. A large number of demonstration projects using low-cost sensors that are being either carried by individual citizen [4] or stationary placed by communities [5, 6] have been presented in the past. Hystad et al. [1] and Castell et al. [2] provide a detailed review of numerous low-cost sensor applications for ambient air monitoring. Devarakonda et al. [7] for example demonstrated a preliminary prototype of a vehicular-based mobile pollution measurement approach for measuring find-grained air quality in real-time.

The *AirCom* system proposed in this study would demonstrate the utilization of heavy-duty vehicle fleets (i.e. goods movement trucks and transit buses) as mobile platforms for low-cost ambient air quality sensors units serving as mobile air monitoring stations allowing to measure criteria pollutants at high spatial and temporal resolution. The data from *AirCom* would supplement current fixed monitoring stations, with better spatial resolution and help identify hot-spots of criteria pollutants within the confines of the representative area of a stationary air quality monitoring station. Initially the use of miniature low-cost sensors could pose quality assurance limitations, however future advancements in sensing technologies combined with the outcome of this network demonstration study would lay the foundation for a robust air quality monitoring network that would address complex spatial and temporal variations in pollutant concentration over extended regions of the country.

The versatility of *AirCom* offers the EPA with an observation network that can evolve to address specific geographies, new standards, different instruments, and air pollutants of interest. Also, the network could assist in bridging the spatial data void between the SLAMS (that monitor regions of interest to the state and local agencies) and the NAMS (that monitor urban regions with high population density). Not only does *AirCom* provide the EPA with an observation network, but also a surveillance network that can alert authorities that certain pollutants or compounds were detected at a specific location. Figure 1 depicts the data path and system layout

of the proposed *AirCom* ambient air monitoring system.
The *AirCom* could serve as tool in effectively reporting roadways pollutant concentration, especially in an urban scenario. The network of ground vehicles moving through the traffic would report real-time pollutant concentrations and meteorological data at regular spatial and temporal intervals. Meteorological data combined with air quality information along the measurement routes could enhance the scope for efficient air quality modeling and better understanding of health effects.

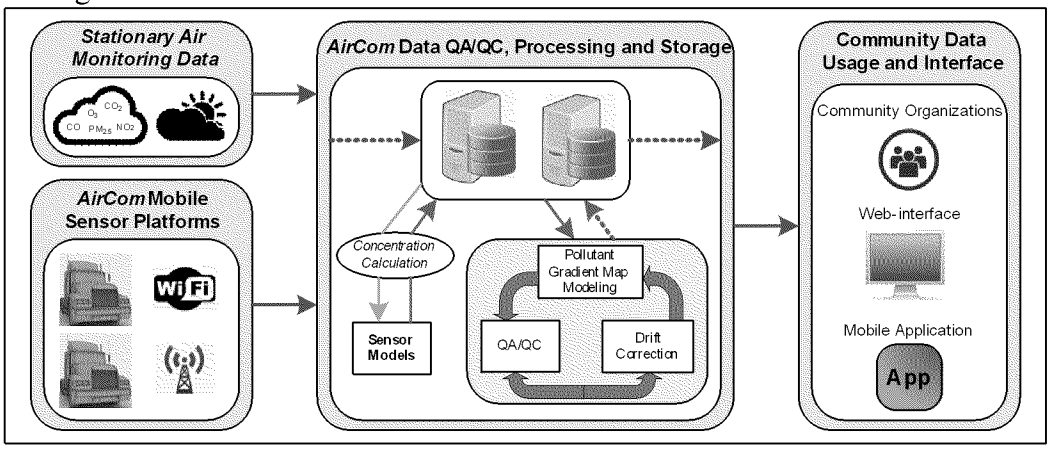

Figure 1: System layout of the *AirCom*.

Three different modeling approaches have been traditionally used to generate concentration gradient maps from individual ambient air monitoring station data [1], including i) land-use regression (LUR) models, ii) dispersion models (e.g. Community Model for Air Quality (CMAQ)), and iii) spatial interpolation methods (e.g. kriging methods). LUR is a stochastic modeling approach using multivariate regression with ambient pollutants being the dependent variables. Once the model is developed, pollutant concentrations at any location within the study domain can be predicted. The advantage of LUR methods is their cost effectiveness and ability to identify emissions hot-spots, however, are plagued by shortcomings in their ability to resolve meaningful short-duration temporal trends [1]. A study by Marshall et al. [8] comparing LUR, spatial interpolation and a community multi-scale air quality model, for assessing spatiotemporal variability, found that LUR models (i.e. neighborhood-scale) have the finest spatial resolution compared to the other two approaches (i.e. urban-scales). Ryan et al. [9] provide a review of land-use regression model studies and show that such models better characterizes air pollution exposure source and patterns by assessing multiple location sites with the model incorporating prominent variables such as road type, traffic count, elevation, and land cover. Dispersion models such as the CMAQ calculate receptor level pollutant concentrations based on Gaussian pollutant dispersion parameters combining data from ambient air concentrations, meteorological, topographical data as well as source-receptor distance and time information [1]. CMAQ is traditionally applied to urban and regional scales. The primary disadvantages of CMAQ are the demand for high-quality input data as well as the need for high-power computing. Cyrys et al. [10] compared dispersion to LUR models and results indicated similar success in explaining variability in measured concentrations of air pollutants.

b) The secondary objective of the study is to identify compact, high-sensitivity sensor technologies capable of forming the basis of future ambient air quality measurement

network. The identification of sensors would be followed by a detailed investigation of possible factors influencing air quality measurements through a mobile platform.

The implementation of the Clean Air Act required EPA to set National Ambient Air Quality Standards (NAAQS) for six criteria pollutants (CO, NO_2, O_3, SO_2, Lead, PM_{10} and $PM_{2.5}$). These were further divided into a primary and a secondary standard, where the first is intended to protect the public health, including the health of "sensitive" populations (children, elderly, asthmatics, etc.) and the latter to protect the public welfare (damage to environment, animals, crops, buildings, etc.) [11]. Title 40, subpart 50 of the Code of Federal Regulations (CFR) describes maximum pollutant levels, measurement as well as calibration methods [12]. Conventional air quality monitoring, under these regulations, is performed using Ultraviolet Fluorescence or Pararosaniline methods for SO_2, NDIR methods for CO, Chemiluminescence methods for NO_2 and high-volume sampling methods for PM, all of them being labor and cost intensive to operate and requiring considerable amount of space; hence, are limited to stationary measurement stations [12, 13]. However, long term needs for air quality monitoring, especially for mobile applications, include compact, real time, high sensitivity sensors with low power consumption and wireless communication capabilities.

State-of-the- art micro-sensors are dominated by a variety of solid state semiconductor oxides, detecting gases based on a change in electrical resistance of a porous sensing body, and miniaturize electrochemical cells [14] that produce an electrical signal proportional to the gas concentration based on chemical reactions between the gas of interest and an electrode. Although, these types of micro-sensors can be produced on a mass basis at low costs, their application to air quality monitoring is currently limited due to lack of accuracy, sensibility as well as reliability [15]. Depending on the production method, the baseline resistance of SnO_2 based metal oxide sensors is reported to vary by up to a factor of 5 with a typical sensitivity spread between a factor of 2 to 8, depending on the target gases [16]; hence, individual calibration of each sensor would be necessary. Furthermore, current metal oxide type sensors are affected by changes in temperature, humidity and the presence of interfering gases [17] and therefore need integrated compensation algorithms. Electrochemical type sensors on the other hand are minimally affected by pressure changes, however, are quite sensitive to temperature variations [14]. Recent research has focused on Tungsten-Trioxide (WO_3) materials [15, 17], among others, since they showed particularly large resistance-increase signals in response to low concentrations of oxidizing gases such as O_3 and NO_2 and didn't exhibit SO_2 poisoning and surface hydration-dehydration effects frequently experienced with SnO_2 materials [17]. A month long comparison between reference instruments and WO_3 based semiconductor sensors reported stable measurements results for NO_2 and O_3 at atmospheric levels without recalibration [17]. There is however, only a very limited amount of actual in-field studies reporting correlations between newly developed micro gas-sensors and EPA certified reference methods in terms of sensitivity and long-term accuracy. Moreover, the majority of sensor technologies discussed, capable of measuring pollutants at atmospheric levels (ppb) as required by the NAAQS, are still in development state and not yet commercially available [15].

While the aforementioned technologies represent a major step forward, current materials advances represent a potential leap forward in sensing capabilities. Graphene (i.e., films comprised of one to several atomic carbon layers) is among those materials showing great promise in the area. Because of its high carrier mobility, low carrier densities, and low noise levels graphene provides the basis for high speed and high sensitivity gas and liquid species sensors. As an example of both the sensitivity and low noise level of graphene based sensors,

Schedin et al. [18] have demonstrated the detection of individual gas molecules adsorbed on graphene. Despite the huge opportunity provided by graphene based sensors, there are significant materials and technology barriers which must be overcome. First and foremost, large area graphene films (wafer scale) are required for the production of the sensor platform. Second, methods controlling sensor selectivity / specificity must be established. Third, in addition to the usual inorganic gas species (e.g., SO_2, NO_2, CO, CO_2, NH_3, and O_3), it is highly desirable to have sensors which can identify the hydrocarbon species which either coat or comprise environmental particulate matter. Research at West Virginia University (WVU) is presently focused on these three key areas has already demonstrated the feasibility of producing large area graphene films on 6H-SiC using halogen based plasma etching methods [19, 20]. Two methods of achieving target specificity with graphene films are being explored. In the first approach, arrays of electrically readable graphene areas on the sensor platform will each be coated with metal nano-dots (or a porous nano thin metal film). When a gas adsorbs on the metal, the carrier density (i.e., the doping level) of the graphene will be altered, and this change can be detected electrically. Because gases adsorb differently on different metals, arrays coated with different metals will provide a response indicative of the specific gas. The second approach to achieving target specificity involves functionalization of the graphene with target specific receptor molecules. When a target molecule binds to its receptor, changes in electron charge distribution of the complex will alter the doping level of the graphene. As before, this change can be detected electrically and represents the sensor response. This approach is particularly useful for organic molecules which either coat or comprise environmental particulate matter.

Additional to gaseous pollutants, the NAAQS also limits the PM_{10} and $PM_{2.5}$ mass based concentrations, averaged over a 24-hr and annual period. Current EPA reference methods include high-volume sampling with subsequent gravimetric analysis, Beta Attenuation Monitor (BAM), Tapered Element Oscillating Microbalance (TEOM™) and Nephelometer. These methods however are, similar to the gaseous reference methods, labor and cost intensive, require bulky instruments and need in case of gravimetric and BAM methods frequent change of sampling filters or tape, respectively. The TEOM method requires a stable instrument setup which, in case of mobile application, would involve an elaborate construction to dampen any vibrations caused by the moving sampling platform. Moreover, recent health studies showed evidence that PM exposure on time scales of less than a few hours can lead to adverse health effects, especially for "sensitive" groups of the population [21]. However, current ambient PM sampling methods operate on multiple hour averages; hence, are not able to account for short-term PM variations. The most promising instruments to date for real-time PM mass concentration measurements at atmospheric levels are based on light scattering technology, which continuously measures the amount of scattered light due to particles flowing through a sensing zone. These measurements can further be related to particle concentration using the well-established light scattering theory derived by Kerker et al. (1969) [21]. The primary limiting factor for optical PM mass instruments arises from the fact that they are typically not capable of measuring particles less than approximately 0.2μm in diameter and are therefore not able to account for a significant amount of particles related to primary engine combustion emissions ($\leq$ 0.1μm). Additionally, instrument specific sample preparation methods (dilution, heating) may volatilize organic PM prior to measurement; hence underestimating the amount of volatile and semi-volatile compounds that may account for a considerable amount of combustion derived PM [22]. Currently, there exist several commercially available instruments, sensitive to particles between 0.1 and 10μm and often possible to be equipped with different cut-size cyclones to

distinguish between TPM, PM_{10} and $PM_{2.5}$.

2 Approach/Activities

WVU proposes to instrument a fleet of heavy-duty vehicles, more specifically, freight moving trucks and transit buses with *AirCom* ambient air quality sensor units. These vehicles will serve as mobile air quality measurement platforms while traveling within their designated area of operation. Deploying the sensor units on commercial fleets has the advantage that i) fleet operators and vehicle maintenance personnel can be specifically trained on using the sensor units and identifying possible hardware malfunctions, thus, assuring increased quality of sensor data (i.e. acting as first data QA/QC step) and ii) vehicles are predominantly operating on predefined routes allowing for a more consistent and spatially distributed data stream as opposed to sensors installed on private cars (i.e. due to increased possibility of vehicle clustering and infrequent operation), thereby improving the resolution of air quality monitoring over a larger area.
Data from pollutant sensors along with metadata including meteorological and vehicle location information will be sent from the individual *AirCom* units via wireless or cellular communication to a central server located at West Virginia University's main campus in Morgantown, WV. Using sensor response models developed as part of this proposed research, raw *AirCom* data will be converted to actual pollutant concentrations. A combination of land-use regression (LUR) models and EPA's community multi-scale air quality model (CMAQ) in conjunction with pollutant concentration information from fixed air quality monitoring stations, located within the area of mobile platform deployment, will be applied to perform in-situ sensor quality validation, outlier identification, and sensor data drift correction. Finally, CMAQ modeling will be utilized to generate pollutant concentration maps and infer air quality index (AQI) values that will subsequently been disseminated to community organizations and the broader public through interactive web-based interface and mobile device applications in the form of spatial and temporal resolved gradient maps.
In order to ensure the accomplishment of the primary objectives of this proposed study, the research has been divided into following six main tasks.

Task 1: Sensor Identification and Evaluation.
An important part of the proposed research comprises identification, selection and characterization of commercially available low-cost gaseous and particle phase sensors suitable for measuring pollutants at levels below concentrations specified in the National Ambient Air Quality Standards [1]. From preliminary research into miniature sensor technologies, it has been found that with the exception of carbon-monoxide and carbon-dioxide and ozone sensors, measurement of other criteria pollutants through micro sensors still pose significant challenges with respect to detection limits, accuracy and variability. Major limitations of miniature sensors can be summarized [2, 23, 24, 25], but are not limited to, i) linearity of response to increasing concentrations, ii) sensor response specificity and interference, iii) effects of environmental conditions including temperature, pressure and relative humidity of ambient air, iv) suboptimal functioning with atmospheric changes, v) sensor response times, vi) repeatability and long-term drift.
During this task, miniature low-cost sensors will be identified for measuring gaseous criteria pollutants of CO, CO_2, ozone (O_3), and nitrogen dioxide (NO_2) as well as sensors to measure particle phase $PM_{2.5}$ emission concentrations. Primary selection criteria will include i)

measurement range, ii) resolution, ii) lower detection threshold, iii) accuracy, iv) repeatability and long-term drift, v) linearity, vi) sampling frequency (i.e. response time), vii) physical dimensions, and viii) power requirement. Sensor response time becomes especially important for sensor application in conjunction with a mobile platform, as the spatial resolution of the measurement will become a function of vehicle speed and sensor sampling rate [7]. Also, low response times may lead to concentration '*smearing*' effects when traveling at elevated speeds.

Task 1.1: Sensor Response, Interference, Linearity Assessment.

This subtask will comprise of extensive testing of the identified miniature gas and particle phase sensor, at WVU's Engines and Emissions Research Laboratory (EERL) against calibrated laboratory grade reference instruments, as described by EPA's reference methods, complying with detection levels and calibration methods put forth in title 40 CFR, part 50 [12] and processes to ensure data quality for use in NAAQS decisions as outlined in title 40 CFR, part 53.20, and part 58, appendix C as well as title 40 CFR, part 58, appendix A, QA handbook volume II. Sensors can be broadly classified into three sub-categories [25], namely i) sensors behaving as black boxes with and calibrated concentration output, ii) sensors provided with only a model equation for the response, and iii) sensors where no prior information are available to relate the response to a physical measure (i.e. concentration). Studies have identified relative humidity (RH) and ambient temperature to have significant impacts on the sensor response and correction algorithms are necessary to account for their influence [24, 25, 26].

This task will to assess measurement accuracy, zero and span drift and long time stability at low pollutant concentrations as well as sensor response linearity over a wide concentration range. Furthermore, standardized calibration procedures for the selected sensors will be developed. To this aim, WVU proposes to conduct controlled experiments in an ambient simulation chamber allowing for air conditions (i.e. pressure, temperature, and RH) to be varied and closely controlled as well as allow to artificially simulate the chamber atmosphere by adding possible interfering gases. Experiments will be conducted following a design of experiment (DOE) approach including temperature, pressure, RH, and relevant interfering gases as control parameters at different levels (i.e. at least three levels per parameter to asses possible curvature). Reference instrumentation will include an MKS MultiGas 2030HS FTIR and standard NDIR for CO_2, CO as well as CLD-base analyzer for NO, NO_2, measurements. Ozone concentrations will be monitored Teledyne BME400E analyzer.

The European Metrology Research Programme developed as part of their Metrology for Chemical Pollutants in Air (MACPoll) research detailed sensor evaluation procedures outlined in 24, 25. Sensor evaluation and response assessment for this proposed study will aim at taking advantage of these already established procedures.

Task 1.2: Sensor Calibration and Model Development.

During this task response models will be developed for the individual miniature sensors based on data obtained during Task 1.1. Model development will be based on physical properties of the sensor technology, interfering gases and meteorological impacts and closely follow recommendations outline in the MACPoll protocol [25].

Task 2: Design of AirCom Unit.

Task 2.1: Hardware Design of AirCom Unit.

Devarakonda et al. [7] observed that the orientation of the sensor relative to vehicle movement

significantly influences measurements. Therefore, the effect of sensor location on the measurement values needs to be studied to frame guidelines for mobile air quality measurements. The fact that the mobile platform is going to be subject the effects of the measurement sensor moving through the exhaust plume of other vehicles should be considered while placement of sensors. WVU proposes to conduct controlled experiments to evaluate the effect of sensor platform placement on vehicles in order to effectively capture ambient pollutant concentration with minimal interaction from other vehicle emissions sources.

The WVU environmental wind tunnel [27, 28], shown in Figure 2 (exterior view with entrance section open in the foreground), is of a subsonic non-recirculating design. The wind tunnel has a square cross section of dimensions 16ft x 16ft. The WVU wind tunnel has been specifically designed to study exhaust plume dispersion from vehicles and other ambient mixing problems. With that in mind, the test section length (115 feet) has been designed for achieving at least a 2 seconds residence time of the plume at a wind speed of 35 mph within the tunnel. The open circuit configuration of the wind tunnel guarantees no re-entrainment of the diluted plume exiting the tunnel. Further, the wind tunnel inlet section is equipped with honeycomb screens to limit the turbulence intensity within the test section to less than 1%.

As part of this exercise WVU proposes to introduce pollutant streams such as NO, CO and ozone upstream of the sensor network. The sensor platform will be tested at various location on the heavy-duty vehicle in order to discern the effect of vehicle aerodynamics on sensor readings. The readings of the sensor will be compared with slip-stream measurement from MKS 2030 high speed Fourier Transform Infrared (FTIR) analyzer.

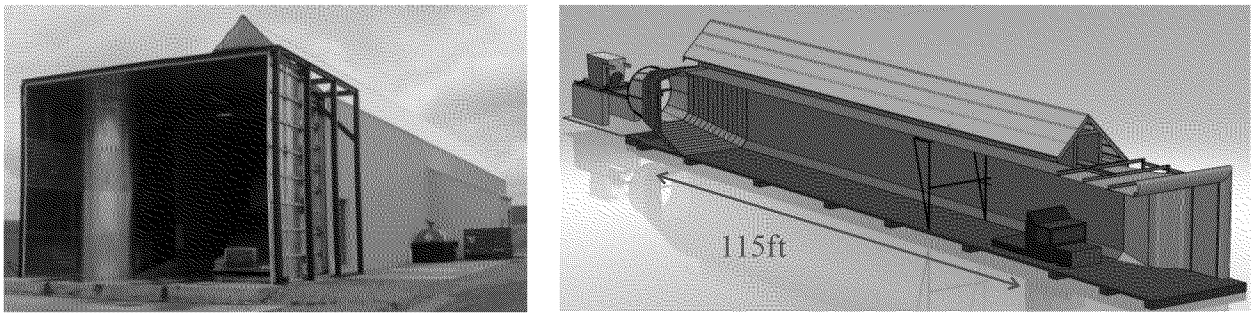

Figure 2: Large-scale environmental wind-tunnel at West Virginia University [27, 28].

Task 2.2: Data Acquisition and Software Design of AirCom Unit.

The electronics of the sensor platform will based on a low-power ARM based embedded Linux system. Of the many choices available to us in this platform, the proposed work expects to use a Beaglebone Black (AM3335x 1GHz ARM Cortex-A8) open-source hardware single-board computer to interface with the sensor data acquisition system. The open-source hardware provides the flexibility to pick and choose the various microprocessors needed for receiving sensor data, and interfacing with the telemetry and GPS chips. The CTT-865 GSM chip

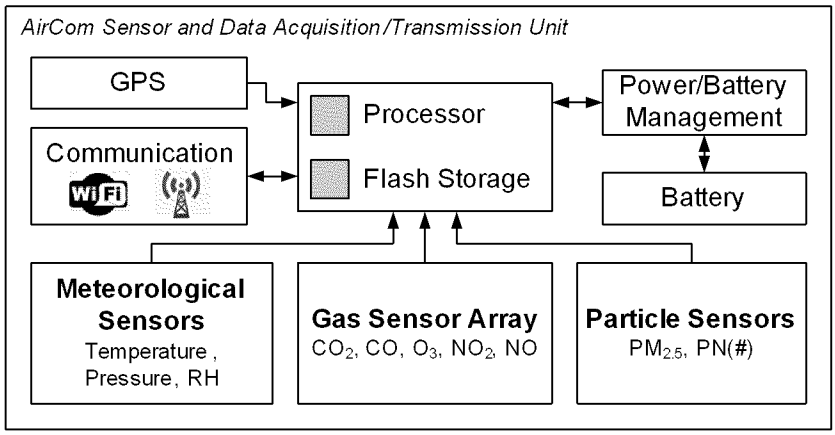

Figure 3: Schematic of *AirCom* sensor and data acquisition /transmission unit.

from cellular tracking technologies will be interfaced with the Beaglebone platform for telemetry applications. A USB Wifi chip will also be interfaced for data transfer in the absence of cellular connections. A SensorCape hardware will provide the Beaglebone platform with sensing capabilities. The SensorCape module is capable of interfacing with different sensor types such as temperature, humidity, ambient light, accelerometers and simple analog sensor outputs. The hardware layout of the AirCom unit is shown in **Error! Reference source not found.**.

Task 3: Sensor Communication Network.

WVU proposes to use Wi-Fi to access public access points, as well as cellular communication modules in order to establish robust communication between *AirCom* and data servers. Depending on availability of public networks and their accessibility the *AirCom* units will switch between Wifi-WAN and cellular network to establish a data link with the WVU server. Once the data link is established the *AirCom* unit will transfer raw digital signal to WVU server for data post processing and archiving. The unit will also house flash storage module that will buffer raw digital signals from the sensors before being uploaded onto the server, thus if the device where to loose connection it will still collect and store the data into the flash storage module until it can re-establish a connection with the server.

WVU server will download data from all sensor devices after ensuring a good data link is established, once the transfer is completed file size and time of logging will be confirmed with the sensor device to verify transmission of data was completed successfully. Once the raw sensor signal data is downloaded from the AirCom unit, WVU server will post process the data by performing necessary calculations for obtaining concentration values and associating them with GPS and meteorological data.

Task 3.1: Data archiving and Post Processing

Archiving and real-time processing of the data would prove to be a significant challenge as processing data from multiple platforms could be computing intensive. During the initial phase of the development of this project, the developed post processing and archiving software will use geographical information system (GIS) tools to monitor sensor signals pertaining to different parameters. This phase of the project will involve the development of quasi real-time post processing, and data QA/QC tools that would monitor sensor performance, process data and communicate with weather servers to append data with corresponding ambient conditions required for dispersion modeling to be performed by Dr. Mejia at DRI.

Task 3.2 Calculation of Ambient Concentrations

During the sensor qualification phase of this study, we expect to characterize interferences, sensor drift and accuracy of the miniature sensors. Upon receiving the raw data from the sensors, offline post processing of the data to account for the quality and performance checks of the sensors will be applied to correct the measured pollutant concentrations. During the initial phase, we anticipate this process to be conducted offline through our server prior to displaying the real-time sensor readings. However, the study expects to perform this task with on-board microprocessors to reduce the delay time in displaying sensor data on the interactive website.

Task 4: Deployment/Installation of AirCom Units on Mobile Platforms.

Task 4.1: Identification of Region of Interest for Mobile AirCom.

WVU proposes to choose a region with a well established network of existing fixed air quality

monitoring stations to demonstrate this project. The metropolitan statistical areas (MSA) of Los Angeles-Long Beach-Santa Ana and Riverside-San Bernardino-Ontario, with an estimated total population of 15.5 millions (based on 2000 U.S. Census), were identified as viable areas. Both MSA's fall under the jurisdictional boundary of the South Coast Air Quality Management District (AQMD) who operates a total of 41 permanent air pollutant monitoring stations (including 36 permanent stations within SC-AQMD area, 3 within the Mojave Desert AQMD area, and 2 additional near-road monitors) as well as a Mobile Monitoring Station (MMS) for temporary deployment to identify possible emissions hot spots (as of October 2014) [29]. This is making this specific area best suited for the proposed project since the number of monitoring stations well exceeds the minimum requirement as mandated by EPA. The vehicle routes would encompass urban and highway regions to demonstrate the spatial and temporal variation in pollution concentration. Figure 5 shows the 41 permanent measurement stations within the enforcement area of South-coast AQMD (i.e. dark line is district border).

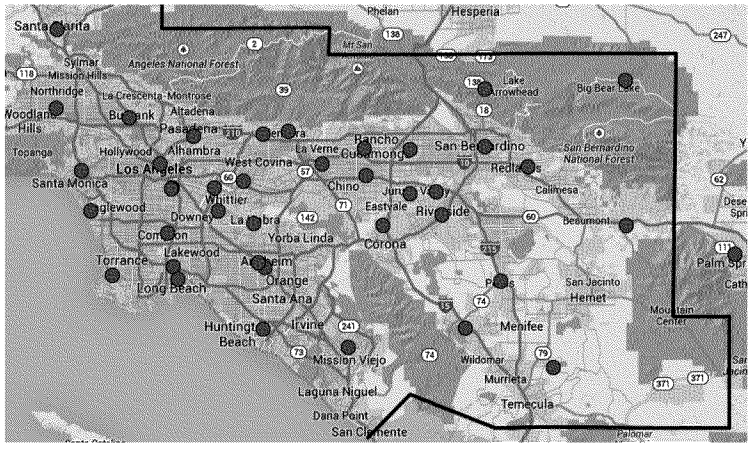

Figure 4: Permanent monitoring stations within the area of South-Coast AQMD.

Furthermore, AQMD's latest annual air quality monitoring network plan [29] identified the need for additional fixed monitoring stations within their air monitoring district in order to achieve increased resolution in ambient air quality data needed to identify pollutant sources that contribute to the current non-attainment of certain NAAQS criteria pollutants. Fixed measurement stations are associated with large costs for instrument purchase, initial setup and operation of the station, thus, making the mobile platform based air quality sensor network *AirCom* a good candidate to provide air quality data at increased spatial and temporal resolution, possibly leveraging the need for additional fixed monitoring stations.

Task 4.2: Installation/Integration of AirCom into Mobile Platforms.

Sensor installation will involve the placement of the *AirCom* sensor units on a fleet of transportation vehicles (i.e. heavy duty goods movement trucks and/or transit buses) and integration with the wireless and cellular communication system. This task will also include training of fleet operators and vehicle maintenance personnel in the handling, operation and error identification of the *AirCom* sensor units. WVU proposes to install up to 40 *AirCom* units on heavy-duty trucks of Ralphs Grocery distribution center (i.e. located in Riverside, CA) whose fleet is primarily operating within the South coast air basin and the greater Los Angeles metropolitan area for initial demonstration of the mobile platform air quality sensor network concept.

Task 4.3: Demonstration of Data Collection with AirCom from Mobile Platforms.

This task will comprise initial demonstration of the *AirCom* system, including data acquisition via the *AirCom* sensor units and communication with the central database on the data storage servers located in Morgantown, WV. Experience with data collection during this task will allow

for identification of possible hardware or software issues while the system is being in use on a daily basis and exposed to real-world influences.
With increasing availability of vehicle fleet partners, *AirCom* could be expanded to other regions of interest and possibly connect the spatial data void between various stationary ambient air quality monitoring stations.

Task 5: Data QA/QC and Validation.
This task would involve the comparison of *AirCom* observation data with AQMD operated ambient monitoring stations for data validation purposes. The AQMD operated measurement stations will serve as reference observation data to the *AirCom* data.

Task 5.1: Development of Models for Establishing Temporal/Spatial Concentration Maps.
Detailed climate simulations intertwined with pollutant transport models are vital to understand the impact of pollutants to the climate and the influence of climate on pollutant transport. One of the biggest challenges in regional climate modeling is the accurate downscaling of global climate models such as the general circulation model (GCM) to regional scales of approximately 12 km in grid size. Regional Climate Models (RCM) developed by DRI as part of a NSF-EPSCoR Climate Change infrastructure development grant (EPS-0814372; 2008-2013; Dr. Mejia-co-PI) have successfully achieved this downscaling simulation to cover the Western United States. The modeling efforts proposed in this study is aimed at updating rather old simulations based on the Intergovernmental Panel for Climate Change fourth assessment report (Pachauri and Reisinger, 2007) with the latest climate simulations based on the IPCC fifth assessment report CMIP5 simulated output (Stocker et al., 2013) [30]. Such newer downscaling products will follow standard procedures based on recommendations from Mejia et al. (under review) and use the Coordinated Regional Climate Downscaling Experiment (CORDEX).
The Community Model for Air Quality (CMAQ) is a state-of-science model developed by US EPA and designed for multiple-pollutant modeling. It implements a fully compressible Eulerian system of equations for chemical transport and modeling of pollutants. It has been widely used to study complex air quality problems for historical extreme pollution events, and employed as forecast systems to predict air pollution episodes for short term periods . CMAQ simulation for the proposed study will follow similar adaptations and analysis as used in ongoing research related to ozone modeling systems, emission control strategies for Lake Tahoe basin, and Yosemite ring fire simulations. Modeling will focus on two types of periods: 1) wintertime cold pool stagnations, with and without snow on the ground; and 2) summer and fall wildfires, both nearby and distant. Several windblown dust episodes will also be examined.
The modeling efforts performed in this task will use both data received from the mobile platforms and data shared by stationary monitoring stations to study the pollutant transport mechanism. This task is important in bridging the information between stationary monitoring data with finer spatial resolution mobile platform data. Results from this task can be used both as a quality check of the mobile sensor data as well as developing a model to link stationary monitoring stations in other regions of the country.

Task 5.2: Developing and Assessing Data QA/QC Schemes.
Air quality data collected by AQMD within the boundaries of the *AirCom* sensor network will serve as a data quality indicator of the *AirCom* observation data. Due, to the conceptual nature of this study and the proposed use of miniature sensors for ambient air quality monitoring,

anomalies in the data need to be verified with standard reference practices. AQMD operated SLAMS, SPMS and the Mobile Measurement Station (MMS), will serve as tools to compare and validate the mobile platform data. The advantages of mobile measurement trailer operated by AQMD for air quality monitoring in remote locations will be used for validating mobile platform data in specific regions of interest.

Significant temporary increase in pollution levels is a phenomenon that can be caused by passing vehicles which emit elevated mass of emissions (i.e. high emitter, legacy vehicles) [7]. However, such pollution surges are only temporary and are not representative of '*true*' average concentrations for the given area, thus, they will need to be labeled as outliers in order to not negatively affect modeling of local concentration maps. Algorithms will be developed to indentify such events within the stream of raw data and exclude them from further data processing.

Task 6: Connecting AirCom Data with Communities.

A more detailed description of the community engagement plans and data dissemination to the public, as proposed in this study, is given in chapter 5 "*Community Engagement and Communications Plan*".

2.1 Sustainability

West Virginia University's Center for Alternative Fuels and Engines and Emissions (CAFEE) is committed to sustainability as demonstrated by our research activities. The proposed research aims to efficiently monitor air pollution at greater spatial and temporal resolutions, so as to help regulatory agencies in effective air quality planning. The exposure of the human population to air pollution, varies in with geography, time of year and type of occupation. Ambient pollutant monitoring technologies currently used are not capable of discerning the human exposure to pollutants at finer spatial and temporal grid. This shortcoming of current ambient air monitoring methodology could result in under or over prediction of pollutant exposure to humans. Therefore, this proposed research will study the pathway of using miniature sensors housed on mobile vehicle platforms to capture the variations in pollutant concentration in ambient air as a function of time and location. The study focuses on identifying the limitations, advantages and protocols for effectively using low-cost sensors to achieve data quality comparable to that of state-of-the science stationary monitoring stations. The overall goals of the project supports environmental sustainability by identifying a pathway to efficiently monitor air pollution distribution.

Moreover, the study places emphasis on the active participation of communities in achieving the proposed environmental sustainability. Trainings, workshops and interactive data dissemination are the core pathways adopted in this proposed work to engage active participation of communities in air quality monitoring activity. The project emphasis lies on the fact that societal awareness of air quality problems, challenges in measurement and current technology is the most efficient pathway to mitigating air quality issues in non-attainment regions of the country.

2.2 Expected Results and Outcomes

The major outcome of this proposed research is the measurement of ambient concentrations of criteria pollutants of CO_2, CO, NO_2, ozone and $PM_{2.5}$ at fine spatial and temporal resolution. The versatile approach of using heavy-duty vehicles, in specific goods movement trucks and transit buses as mobile platforms, affords the ability to cover both rural and urban regions. The existing

measurement and communication network could be scaled to a larger region with the potential success of this study and could result in a nationwide monitoring network, which could supplement and support fixed monitoring stations. Temporal resolved pollutant concentrations could further aid in real-time traffic control, preventing the creation of pollutant hot-spots during given periods of a day, by means of actively diverting traffic around such areas (e.g. reduce number of highway lanes, close highway entrances).

The proposed study is also expected to create an extensive awareness of air quality challenges faced by many cities in the country. In specific the study will focus on the air quality in non-attainment regions such as California and its impact on the health of the population. The study expects the users of the mobile platform to be adept in the use of mobile sensors and actively participate in collecting air quality data that could potentially alleviate people's interaction with high ambient pollutant concentration. Moreover, the interactive dissemination of *AirCom* data through web-interface and mobile cellular phone application will empower a large group of the population to track AQI and take preventive steps to improve the AQI within their district. The use of mobile sensor platform data in conjunction with atmospheric pollutant dispersion modeling can potentially help bridge the spatial gap between fixed ambient monitoring stations.

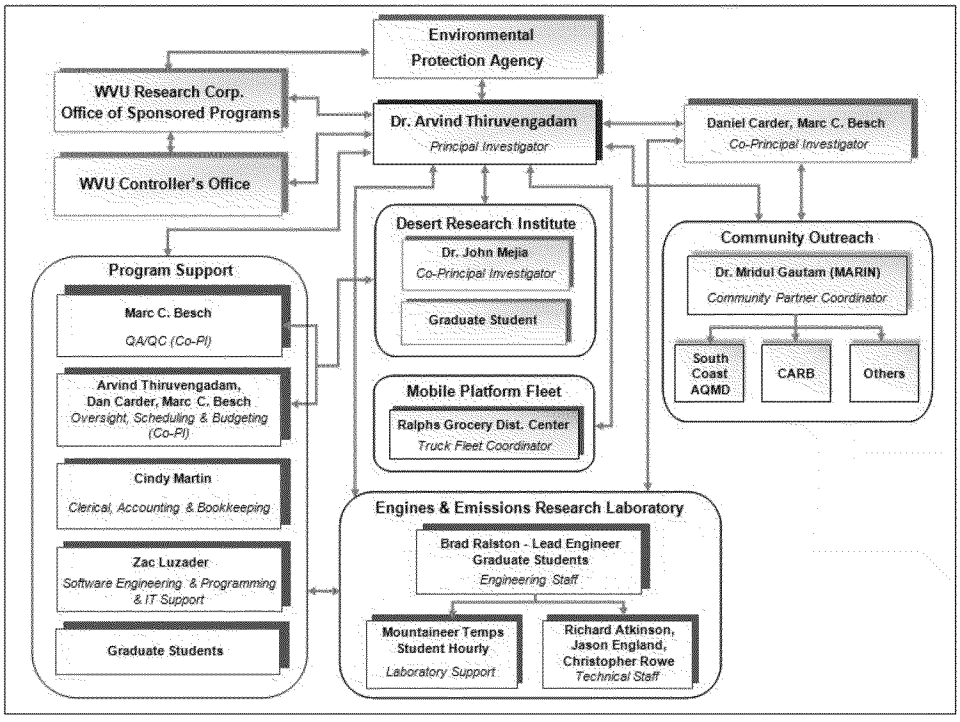
2.3 General Project Information

2.3.1 Facilities

West Virginia University's Center for Alternative Fuels and Engines and Emissions (CAFEE) is an internationally recognized research program in the area of vehicles, engines, emissions, and alternative fuels. CAFEE is a large research center involving over 50 faculty, staff, and graduate students, which have been conducting research specifically focused on fuels, engines, and exhaust emissions since 1990. Since its inception, this Center has conducted hundreds of research projects with total funding of over $80 million. The projects were or are currently sponsored by fuel suppliers (BP, ARCO, Chevron, Biodiesel Board, and others), engine manufacturers (Cummins, Caterpillar, Detroit Diesel, and others), vehicle manufacturers (Ford, GM, and others), Federal Government Agencies (DOE, DOT, EPA, DARPA, and others) and State Agencies (Calif. ARB, Arizona DEQ, NY DEQ, TCEQ, and others). These projects have addressed issues associated with the full spectrum of fuel, engine, and vehicle performance. Emissions are measured in accordance with the Code of Federal Regulations (CFR 40) requirements for engine certification, which is used primarily for fuels testing, certification, and verification procedures for the states of California and Texas. The Center has developed its own analytical measurement, control, and analysis systems in order to comply with various federal test procedures and specific test requirements. Laboratories have been designed as fully self-contained units that can be transported to remote field test sites. Throughout its history, it has been involved in targeted engineering applications in unique areas of field research.

2.3.2 Personnel

The flowchart of the Project Management Plan depicts the relationships between contractual and technical chains that will be proposed under this submittal. Throughout all phases of the study, the primary contractual and technical contact will be the Project Manager, **Dr. Arvind Thiruvengadam**. Full program oversight will also be the responsibility of the Co-Principal Investigator, thus providing necessary redundancy for management contact.



Dr. John Mejia will lead the pollutant modeling efforts of this proposed research from DRI. Dr. Mejia will coordinate the computing schedule and modeling efforts at DRI. The Co-investigators will provide technical consultation and management experience. **Mr. Marc Besch and Mr. Daniel Carder** will serve as the daily technical contacts for the program, and will interface directly with **Dr. Thiruvengadam**. They will provide on-field support for data collection and QC/QA of the data. WVU graduate students will be involved in sensor evaluation, development of sensor calibration models, design and implementation of the *AirCom* sensor units, while being assisted by scientific personnel and laboratory technicians. Instrument preparation and execution of test plan will be responsibility of the graduate students. Graduate students will directly report to **Dr. Thiruvengadam** in a daily basis. **Mr. Marc Besch** will serve as the QC/QA officer for the program. He will hold primary responsibility for project QC/QA, and reports directly to the program manager (**Dr. Thiruvengadam**). The QC/QA officer is independent of the functional groups that generate measurement data. **Mr. Richard Atkinson** and **Mr. Zac Luzader** will be available for project technical support throughout the project. Both provide necessary IT support from data acquisition and reduction, through system control and analytical systems instrumentation maintenance. **Mr. Luzader** will be the primary software engineer responsible for data acquisition software implemented to the *AirCom* sensor units, communication schemes between the mobile sensor units and central servers for data storage as well as generation of the necessary web interface for the purpose of data dissemination with the community members and organizations. Furthermore, any mobile applet development necessary for data dissemination will be programmed by **Mr. Luzader**. **Mr. Carder** will provide the necessary laboratory program management, including personnel scheduling and budget oversight. **Mr. Carder** will manage the activities of the WVU MAE Department accounting staff in order to track expenditures and apprise the principal investigators of project status. **MARIN LLC. (Dr. Mridul Gautam)** will establish and coordinate the involvement of the community partners and provide training sessions to partnering organizations. South-Coast AQMD will serve as the primary partnering organization representing the communities of the South coast air basin. **Ralphs Grocery Distribution Center** (Greg Peterson) of Riverside, CA, will provide and coordinate the operation of heavy-duty trucks from their fleet as mobile test platforms for installation of the *AirCom* sensor units.

2.4 Project Schedule

A detailed project schedule for the first, second as well as for the consecutive third year is given in Figure 5, Figure 6, and Figure 7, respectively. Bi-weekly progress meeting with all project team members and administrative assistants will be conducted to assess budget expenditure and timely progress. The project meetings will also serve as internal review meetings to assess data quality, data transfer between WVU, DRI, MARIN and the community partners, possible issues and strategies to mitigate delays.

Task Name	Duration	1st year: Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec	Jan	Feb	Mar
Task 1: Sensor Identification and Evaluation	4 W												
Task 1.1: Sensor Response. Interference, Linearity Assessment	4 W												
Task 1.2: Sensor Calibration and Model Development	8 W												
Milestone 1: Completion of sensor identification and evaluation. **Phase 1:** Progress Report													
Task 2: Design of AirCom Unit	4 W												
Task 2.1: Hardware Design of AirCom Unit	8 W												
Task 2.2: Data Acquisition and Software Design of AirCom Unit	16W												
Milestone 2: Completion of AirCom unit system designe and data acquisition software. **Phase 2:** Progress Report													
Task 3: Sensor Communication Network	4 W												
Milestone 3: Completions of sensor commmunication network. **Phase 3:** Progress Report

Quality Assurance Statement

An overview of proposed program quality assurance and quality control is included in this section. Due to content length restrictions, a detailed plan is not included, but shall be forwarded to the EPA upon request of additional plan details.

2.5 Responsible Party for Program QA/QC

The West Virginia University Center for Alternative Fuels, Engine and Emissions (WVU CAFEE) is committed to implement a Quality Control/Quality Assurance (QC/QA) program to assure generation of measurement of data of the highest quality. This data quality will meet all objective requirements. The responsibility of the QC/QA rests on one of the senior investigators (the principal investigator or the Co-principal investigators) who are often designated as senior engineers on several projects. The QC/QA engineer reports directly to the Project Director/Principal Investigator who then shares the data with the Co-Principal Investigators. The primary responsibility for management and execution of the project for conducting a work assignment and associated deliverables rests with the PI. The Co-PIs bring in their expertise and form an integral part of the management and execution plan.

The QC/QA officer will work with the project engineers to ensure that the daily activities are logged, calibration gases meet the stated requirements (discussed in detail), all instruments, sensors, sampling systems, and data acquisition systems are maintained and operated in accordance with the stated plan.

2.6 Project Objectives as Related to QA/QC

The primary objective of the project is to demonstrate the real-time data collection of ambient air pollutant concentration through sensors placed on a network of transportation vehicles. Due to the complexities and uncertainties involved in this method of ambient air sampling, a strict QA/QC procedure would be adopted to validate and provide quality data to accomplish this primary task. The message from the mobile platform will be QC flagged in the event of any loss information pertaining to vehicle information, time, location and sensor data. All mobile platform observations are linked to the platform with a unique ID that is fixed. If a problem sensor is identified, the data provider is notified so that instrumentation can be replaced. Comparison of data amongst multiple mobile platforms would be carried out to assess the accuracy of the readings. In the event of deviations data will not be discarded, instead will be flagged for further offline QC checks.

The secondary objective of identifying sensors and validating them would be carried out through existing QA/QC practices adopted by WVU engines and emissions research center together with required practices from EPA. The sensors would be calibrated and verified against laboratory grade analyzers that have been certified to have an accuracy of 1% traceable to NIST. All emissions measurement instruments are calibrated using appropriate ranges of calibration gases, which in the current case would be concentrations observed at ambient levels.

2.7 Project Elements

2.7.1 Collection of New/Primary data:

Data quality objectives and acceptance criteria, characterized in terms of accuracy, precision, detection limits, completeness, and representative, will be set based upon intended uses. Since, the project involves the use of miniature and prototype sensors for sensing ambient pollutant

concentrations, the QA/QC will strive to meet the QA standards prescribed for ambient air quality monitoring and methods for calibration and sampling will be based according to the procedures prescribed in 40 CFR Part 50 for the chosen criteria pollutant in this study. A minimum performance goal of 85% successful data capture will be implemented. Achievement of this goal will require vigilance on the part of field operations personnel to detect and address variations in instrumental performance in a timely manner.

Stationary monitoring stations compliant with ambient air quality measurement standards would be used to provide an indication of the minimum and maximum bounds of the ambient pollutant concentrations over a spatial region. Data would be QA/QC flagged in the event of a large deviation in sensor observations from within these bounds. Subsequently, an offline analysis of the sensor data, involving the history of data received before and after the flagged time period would be analyzed to verify drift or sensor malfunction.

2.7.2 Use of Existing/Secondary Data

For the purposes of the efforts proposed herein, secondary data will be those data not acquired from the *AirCom* system. Therefore, those data, used for comparative and integration efforts, will be obtained primarily from AQMD's MMS and SLAMS and SPMS. As these data sources are well-documented, no additional information shall be presented herein.

2.7.3 Method Development

The integration of additional air quality sensors into the *AirCom* infrastructure will require refinement in system maintenance and calibration standards. The research team will begin with manufacturer specifications, but will conduct extensive drift studies, both within and outside of a laboratory environment. During the demonstration phase, it is anticipated that data provided from multiple sensors will be compared to one another in order to identify sensor drift or deterioration The research team will implement a two-tier approach in order to identify/characterize/quantify outliers. First, if data are invalid due to deviation from the specified test procedure and cannot be corrected using a redundant measurement, then it will be marked as invalid and the data will be removed from the dataset. Secondly, if there are no known physical reasons why the data should be excluded from the dataset, the statistical significance of the disputed data will be examined. The methodology described in Schiff and D' Agostino (1996) will be employed for the dataset with a 1% significance level. It is noted that the second approach is the same methodology employed in ASTM E178-02 (2002), Section 6. Identification of a statistically significant outlier will result in the *AirCom* unit being recalled in order to perform inspection and maintenance procedures.

2.7.4 Development or Refinement of Models

The data provided by the mobile air quality measurement platform will be used to enhance the existing air quality database. Specific modification of air inventory models in order to accommodate these mobile data has not been deemed to be within the scope of this proposed effort.

2.7.5 Development or Operation of Environmental Technology

2.7.5.1 Overall Purpose and Anticipated Impact of the Technology

The objectives of the study are two-fold: (1) to improve air pollution measurement technologies and (2) to address emerging air pollution issues and improve the spatial and temporal coverage

of air pollution measurement data. The proposed mobile network will provide data from a variety of locations without the need for multiple fixed monitoring stations. These data can be integrated with the current air quality measurements from fixed stations in order to enhance spatial and temporal resolution of air inventory models.

2.7.5.2Technical and Quality Specifications

The current specifications for the *AirCom* system components are included below in Table 1.

Table 1: *AirCom* Weather Sensor Accuracy and Resolution.

Parameter Monitored	Range	Accuracy	Resolution
Air Temperature	-40 to + 80 °C	± 0.2 °C over the range -15 °C to + 85 °C; ± 1.0 °C over the range -40 °C to -15 °C	0.0625 °C
Barometric Pressure	300 to 1100 hPa (mBar)	± 0.5 hPa (mBar)	0.01 hPa (mBar)
Humidity	0 to 100% Rh	± 2% over the range 20 to 80%; ± 3% over the ranges 0 to 20% and 80 to 100%	0.04% Rh
Light Level	0 to 128000 Lux (human	± 10 Lux	10 Lux
Ozone Level	0 to 250 ppb	± 10%	1ppb

Although a significant portion of the program involves the determination and implementation of optimal air quality sensors, preliminary sensor accuracies and resolutions are included (Table 2).

Table 2: Sensor Information for Preliminary System Identification.

Parameter Monitored	Range	Accuracy	Resolution	Response Time
CO2 NDIR	0 to 2000 ppm	± 10 ppm at 20ºC Operating Temp. Range -20ºC to +50ºC Humidity Range 0 to 95% RH (non-condensing)	2.5 ppm	< 40s (T_{90}) at 20ºC
CO (Electrochemical)	0 to 500 ppm	± 3.1 ppm at 20ºC Operating Temp. Range -20ºC to +50ºC Humidity Range 15 to 90% RH (non-condensing)	1 ppm	< 30 sec (T_{90})
CO (WO3 Semiconductor)	0 to 25 ppm	± 0.2 ppm at 20ºC	0.01 ppm	< 180 sec

2.7.5.3Procedures for Documenting and Controlling Design Changes

Any proposed design changes will be at the discretion of the *AirCom* system management team.

2.7.5.4Procedures for Documenting the Acceptability of Processes and Components

Identification/implementation of candidate air quality sensors will involve benchmarking to quantify drift and accuracy, using NIST-traceable calibration gases and NIST-traceable gas dividers. Benchmarking will be performed in laboratory and in-field environments.

2.7.5.5Proposed System Documentation Requirements

A document outlining the operating guidelines for mobile air quality prototypes, as determined from the proposed activities, will be authored at program conclusion.

2.7.6 Conducting Surveys:

The activities proposed by this research team are intended to demonstrate that air quality measurement improvements can be afforded through the enhancement of an existing mobile weather data telematic system. Considering that the objective is a "proof-of-concept" for the manner in which these data may augment current air quality measurement infrastructure, a

thorough investigation of survey size and scope has not been provided, nor will statistical techniques for determining the weighting of the proposed mobile data be provided.

Data Management Plan

The proposed effort includes a process through which data generated by *AirCom* miniature sensors units mounted onto mobile platforms will be acquired, transferred and stored in a database. The database will contain all raw sensor measurement signals and will be used to further qualify the sensor data for its accuracy and precision using data queried from fixed ambient air monitoring stations within the region where the *AirCom* network is being applied (i.e. South-coast air basin, CA). Also, the database will be instrumental in providing the data required to develop models to represent spatial and temporal concentrations of the measured pollutants and their interaction with ambient atmosphere. WVU has developed in-house software based on the Python™ programming language for the acquisition of data from various instruments and sensors through a central data acquisition system. Continuous data streams from individual instruments and/or sensors is stored along with meta data pertaining to i) the instrument/sensor, ii) the method of measurement, and iii) any necessary calibration information and/or coefficients for the given instrument/sensor. All acquired data is automatically stored on multiple network storage systems (i.e. at the minimum on two independent storage systems) for backup purposes.

The PI will engage with the WVU Office of Information Technology (OIT) to develop the appropriate protocols to insure that data is not only archived but also positioned for dissemination as noted below.

2.8 Expected Data and Availability

The data generated by this grant include:

1) Primary sensor data from *AirCom* mobile sensor units including i) concentrations of pollutant sensors (i.e. CO_2, CO, NO_2, O_3, $PM_{2.5}$, PN), ii) meteorological data (i.e. pressure, temperature, relative humidity), and iii) position of *AirCom* mobile unit (i.e. GPS).
2) Processed sensor data after correction, quality assurance and necessary drift correction which is data indicative of '*true*' pollutant concentrations as a function of time and location.
3) Quasi real-time pollutant concentration gradient maps from the CMAQ models for the area of project demonstration.

Data generated from this study will be made available upon request, following an appropriate Quality Control/Quality Assurance (QC/QA) review period. Per EPA's directives, data could be publically released only after publications are generated and accepted by the relevant journals, thesis/dissertation work is published and/or preliminary patents are filed to insure protection of the intellectual property.

2.9 Data Formats and Dissemination

The team recognizes the benefits of freely sharing this data with the scientific community and of archiving in a format that provides maximum interoperability between our collaboration efforts, support modeling studies initiated by interdisciplinary groups, as well as providing support to the users' community to ease their interpretation and analysis of the simulated data. All of the WVU experimental observations will be disseminated though a project website after appropriate quality checks. All of the simulated data based on CMAQ modeling will be distributed under open-source, but governed by the Nevada System of Higher Education and the National Science Foundation policies pertaining to intellectual property, record retention, and data management.

Quasi real-time emissions concentration maps will be made available to the communities and broader public via an interactive web interface and mobile device application allowing to openly query ambient pollutant information broadcasted by the *AirCom* ambient air sensor units.
Raw data will be packaged with necessary executable software or interface utilities that are necessary to utilize commercial software, such as, but not limited to, Microsoft® Excel or MathWorks Matlab®. NetCDF is a very widely used file format that has been specifically designed for storing scientific data, including model output. It is a flexible, self-describing format that bundles data together with any relevant metadata. It can be used to store virtually any kind of data including spatial grids, time-indexed grid stacks, time series, time-indexed profiles (e.g. soil moisture vs. depth) and time-indexed "cube series" and using the so-called Climate and Forecast (CF) convention conformant.
Data will be disseminated though peer reviewed journals and conference presentations.

2.10 Data Archival

All data (paper and digital) and supporting materials will be stored in a way that allows them to repudiate challenges to the work or address requests from other researchers. The minimum period for data retention is three years after the conclusion of the award, or three years after public release, whichever is later. Data related to a student's research work will be retained for at least three years after the degree is awarded. Published data will be available in print or electronically from publishers and stored in the computers of the participants in this project. Given the ever-decreasing costs of digital storage, data may be retained almost indefinitely. Archived data will be available on password protected servers with additional backup maintained off-line.

3 Community Engagement and Communications Plan

The global objective of this proposed research is to communicate to the public quasi real-time air quality information measured using a network of mobile air monitoring sensors. The ultimate expected outcome of this proposed research is to empower the public with real-time air quality information to create awareness and a proactive approach to avoid exposure and mitigate emissions of criteria pollutants. The success of this research proposal is to large extent dependent on the interaction of individuals with the *AirCom* mobile sensor platform. The quality of information relayed by the *AirCom* platform and the proper functioning of the platform is entirely dependent on the level of ownership and responsibility undertaken by the individual operating the mobile platform. This research proposes to use a heavy-duty vehicle fleet such as trucks and transit buses as a mobile platform to install *AirCom*, in order to communicate concentration of criteria pollutants at greater spatial and temporal variations. Although, *AirCom* is designed to operate as a standalone unit with minimal operator interaction, high quality data with greater geographical coverage can be assured with periodic monitoring and maintenance of equipment. The overall success of this research work hinges on both, the engagement of the community, and efficient dissemination of measured air quality as a simple metric to large group of people. One of the important objectives of this study is to provide communities the platform to better understand air pollution as it changes with time and place. This spatiotemporal variation in Air Quality Index (AQI) is illustrated in www.airnow.gov. However, pollutant concentration levels pertaining to various geographical locations are provided to AirNow from stationary monitoring stations. Data from these large spatially isolated monitoring stations are modeled using dispersion models to predict air quality information at various locations. Therefore, this study expects to showcase the air quality data measured by *AirCom* platform at a finer spatial resolution to help identify pollutant hot spots.

WVU proposes to achieve the task of both engaging communities and communicating the air quality information through the following programs:

3.1 Heavy-duty Fleet Engagement

WVU CAFEE has a rich experience of working with South Coast Air Quality Management District (SCAQMD) and California Air Resources Board (CARB) for over a decade through various research contracts. The proposed research expects to engage both SCAQMD and ARB as community partners that can engage heavy-duty truck fleet owners and transit bus agencies to incorporate the *AirCom* sensors in their vehicles. SCAQMD manages multiple programs that provide incentives to heavy-duty fleets to purchase cleaner heavy-duty vehicles. WVU expects to leverage fleet information through SCAQMD partnership to engage heavy-duty fleets to participate as a mobile platform for the *AirCom* sensor network system. Ralphs Distribution Center, Riverside, California is one such organization that has expressed interest in participating this proposed research by providing up to 20 vehicles to be installed with *AirCom* sensor platform. These 20 vehicles were purchased through incentives from SCAQMD and hence are required to operate a minimum of 80% of their total distance within the South Coast region of California. As a result we expect to cover large geographical section of a non-attainment region through the partnership with Ralphs and SCAQMD. WVU has an extensive working experience with transit bus agencies in both Orange County and Sacramento, CA. Through this proposed research WVU will engage SAC Transit Agency to be a participant in providing mobile

platforms for the *AirCom* sensors. Through this partnership the study expects to provide air quality measurements in urban locations such as downtown and residential communities served by SAC transit in City of Sacramento.

The partnership with multiple fleets is imperative for obtaining highly spatiotemporal resolved air quality information. However, the partnership of fleets should extend beyond simply providing a mobile platform and involve a certain level of responsibility from the vehicle operators to ensure proper functioning of the *AirCom* device. Mid Atlantic Research Institute, Nevada (MARIN) will work as community coordinator to provide training sessions to vehicle fleets. These trading sessions will illustrate the current air quality challenges in non-attainment region such as Southern California, the short comings of current stationary air quality monitoring stations and basic principles of various sensing technologies for criteria air pollutants.

The outcomes of these training sessions are improved awareness from fleet partners on the necessity of a mobile platform for air quality monitoring and basic trouble shooting methods to ensure proper functioning of the mobile sensor platform. Publicizing the participation of fleets in this study is an added incentive to large fleets to showcase their participation in clean air activities. The study proposes to distribute vehicle decals showing the fleet participation in EPA funded air monitoring activity during these training sessions.

3.2 Workshop

WVU proposes to conduct a bi-annual, one day workshop in California during the second and third year of the project period to share project status and preliminary sensor data with local regulatory boards and fleet partners. The workshop will involve presentation from project PI on the current status of the project and quality of information collected. These workshops will also serve a medium to communicate with the feet partners the level of participation from their mobile platform operators. These workshops will help WVU convey to the mobile platform operators of any changes to the *AirCom* hardware and develop any additional training sessions if needed. One of the important tasks that will be carried out in this study, is to validate mobile sensor data with data collected from stationary air monitoring stations through a combination of CMAQ and atmospheric models headed by Dr. Mejia from DRI. These workshops will serve a forum to disseminate the high spatial resolution pollutant dispersion model to the air quality regulatory boards. WVU expects to conduct these workshops in conjunction with SCAQMD advisory group meetings that is attended by people from cross-section of the community represented by businesses, academia, regulatory boards and local government body. Attendance of such diverse group of people will help both a critique and steering body of the proposed research. The workshop will also serve as medium to discuss pathways to integrate data from *AirCom* with existing web-based air quality index tools such as AirNow (www.airnow.gov).

3.3 Interactive Dissemination of Data

WVU proposes to develop an interactive website to share quasi real-time data obtained from the server. The website will enable the public to query data from the multiple sensor units to view the spatial movement of the sensor platform and the measured ambient pollutant concentrations from the on-board sensors. The website will be designed to request for a free open-to-all registration, in order to monitor site visitation based on internet protocol (IP) address. The web based data dissemination will be interfaced with a Geographic Information System (GIS) tool

ArcGIS in order to provide a detailed illustration of sensor data over a topographic map of the chosen location. The website will have provisions for a secure login for the fleet partners to report information regarding their *AirCom* device. This platform will provide fleet operators to report problems and ask technical questions regarding the *AirCom* device. Figure 8 gives an example of the web-based interface providing pollutant concentration and metadata for mobile *AirCom* units traveling on individual vehicles.

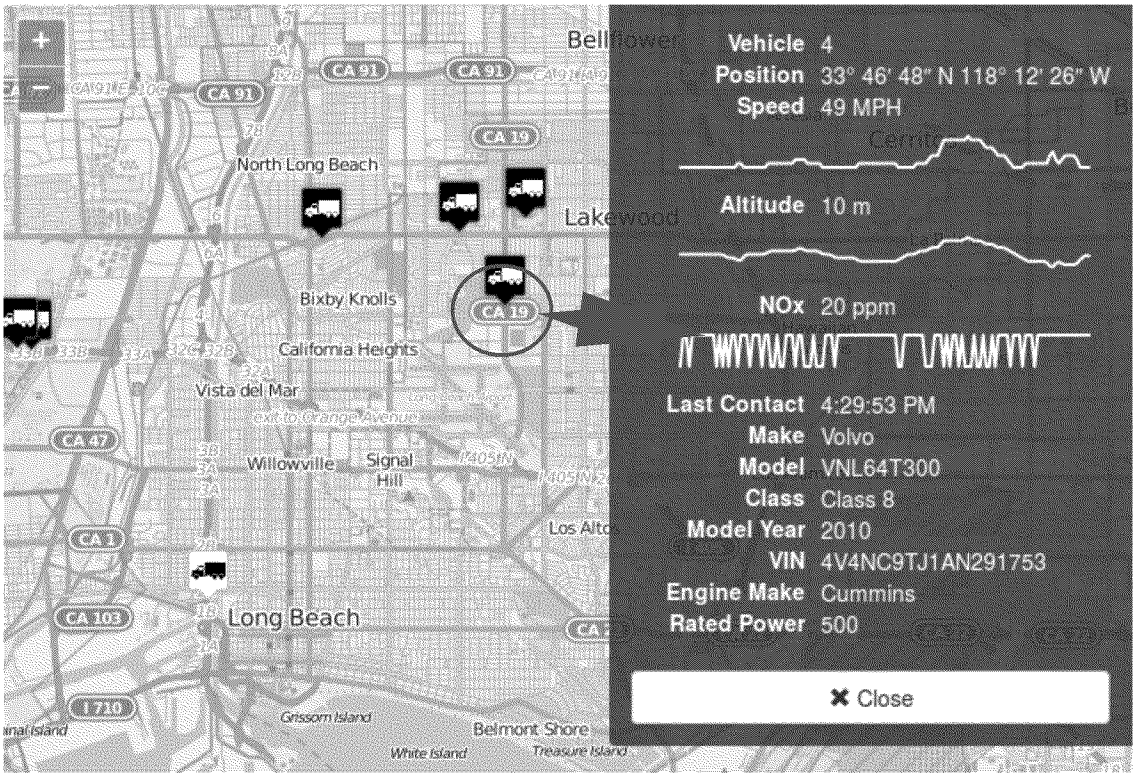

Figure 8: Example of real-time data stream from *AirCom* monitoring unit installed on mobile platform.

Much of the quasi real-time data broadcasted by the sensor platform would be of high value to academic and regulatory communities. However, in order to create awareness about current air quality status, a simpler metric such as AQI associated with a color based legend will have far reaching impact on communicating air quality information. The AQI legend [31] shown in Table 3 below will serve as the metric for communicating air quality status of the chosen location.

Through this proposed research WVU expects to provide air quality data of CO_2, ozone, NO_2, CO and $PM_{2.5}$ at greater spatial and temporal resolution to improve the air quality data presented by the US-EPA through the website www.airnow.gov.

WVU proposes to develop a mobile application that will query the WVU server for location based air quality information. The app will be programmed to alert users during periods of high AQI in their current geographical region. This app should provide users with changing AQI during adverse conditions such as rush hour traffic and forest fires.

Table 3: Color legend for AQI values provided by US-EPA [31] (www.airnow.gov)

Air Quality Index (AQI) Values	Levels of Health Concern	Colors
When the AQI is in this range:	*..air quality conditions are:*	*...as symbolized by this color:*
0-50	Good	Green
51-100	Moderate	Yellow
101-150	Unhealthy for Sensitive Groups	Orange
151 to 200	Unhealthy	Red
201 to 300	Very Unhealthy	Purple
301 to 500	Hazardous	Maroon

One of the current limitations of existing air quality sensor networks are the quality and reliability of the data captured. Conducting data quality checks from multiple sensors at real-time is challenging. Hence, pollutant concentration data will be converted AQI and predetermined threshold levels will inform project investigators of high AQI data. This will prompt an immediate cross verification of the data from the corresponding sensor unit. High AQI data reported from a sensor unit in question will be compared with data from other units passing through the same location to verify the validity of the reported concentration. Also, data from stationary monitoring stations operated by SCAQMD and CARB will be compared with CMAQ modeling to account for pollutant transport and compared with mobile platform data. This procedure will ensure high quality AQI data reported through the website and avoid false "*High AQI*" alerts.

3.4 Data Sharing

The quality of data communicated by the *AirCom* sensor platform is dependent of comparison of mobile platform data with stationary monitoring stations. Although, this proposed research attempts to quantify and characterize the interferences, measurement challenges and accuracy miniature sensors through robust experimental methodology, a reference data set is imperative to conduct periodic sanity check of measured data. Therefore, data measured using stationary monitoring stations will be leveraged to compare against *AirCom* data to validate sensor performance. Conversely, the *AirCom* data measured at a finer spatial and temporal resolution will be shared with local air quality districts operating the stationary air monitoring stations. The data shared between this study and existing air monitoring stations will serve the dual purpose of validating *AirCom* data as well as populating the spatial gap between the various stationary air monitoring stations. Programs such as Congestion Mitigation and Air Quality Improvement Program (CMAQ) of the Federal Highway Administration (FHWA) can leverage the data from this study to evaluate the benefits of their CMAQ activity.

5 Budget and Budget Justification

5.1 Personnel

Proposed labor and costs for the program are included in Table 4 on a yearly basis. Included are the position titles, project role, annual salary, percent effort, and total costs associated for each effort year, as well as a summation for total program.

Table 4: Overview of Labor and Fringe Costs.

	Project Role	Annual Salary	Year 1 %effort	Year 1 Funding	Year 2 %effort	Year 2 Funding	Year 3 %effort	Year 3 Funding	Program Funding
Research Assistant Professor	Principal Investigator, Program oversight	$ 95,000	14%	$ 13,642	15%	$ 14,616	5%	$ 4,872	$ 33,130
Director, Center for Alternative Fuels, Engine and Emissions	Program administrative management	$ 100,845	12%	$ 12,413	5%	$ 5,172	3%	$ 2,586	$ 20,171
Research Assistant Professor	Data QA/QC, field data collection planning	$ 78,202	14%	$ 13,642	15%	$ 13,539	2%	$ 4,872	$ 32,053
Research Assistant	Laboratory data acquisiton system maintenance and setup	$ 75,540	2%	$ 1,880	0%	$ -	2%	$ 1,880	$ 3,760
Software Engineer	Software development for data acquisition and data processing	$ 69,671	10%	$ 6,700	10%	$ 6,700	0%	$ -	$ 13,400
Lab Instrumentation Specialist	Field measurement setup and data collection assistance	$ 45,066	3%	$ 1,156	0%	$ -	0%	$ -	$ 1,156
Associate Field Engineer	On field laboratory equipment and instrumentation support	$ 55,049	2%	$ 1,324	0%	$ -	0%	$ -	$ 1,324
M.S Student	Data collection, analysis and reporting	$ 18,600	50%	$ 9,298	25%	$ 4,649	0%	$ -	$ 13,946
Ph.D Candidate	Data collection, analysis and reporting	$ 22,080	75%	$ 16,559	50%	$ 11,040	50%	$ 11,040	$ 38,639
	Yearly and Program Total			**$ 76,612**		**$ 55,715**		**$ 25,250**	**$ 157,577**

5.2 Fringe Benefits

The following schedule of standardized fringe benefits rates for West Virginia University will be adhered to under the proposed program: Full time (Faculty and Staff) – 25%, Part time – 8.4%, Undergraduate Student – 2.3%, Graduate Student (Graduate Research Assistants) – 9.2%.

5.3 Travel

Travel cost estimates are included in Table 5, below, and are provided based upon previous project travel costing experience, as well as estimates obtained during the time of proposal development. Year 1 costs include travel to California to install the *AirCom* sensor units on mobile platforms (i.e. trucks, transit buses). Year 2 and Year 3 travel budget include travel costs for attending the workshops and mobile sensor platform training to fleet operators.

Table 5: Summary of Program Travel Estimates

Travel Category	Year 1	Year 2	Year 3	Program
Lodging	$ 5,400	$ 2,400	$ 480	$ 8,280
Fuel	$ 1,800	$ 250	$ 250	$ 2,300
Per Diem	$ 3,525	$ 1,140	$ 826	$ 5,491
Airfare	$ 6,000	$ 4,000	$ 4,000	$ 14,000
Rental	$ -	$ -	$ -	$ -
Total	$ 16,725	$ 7,790	$ 5,556	$ 30,071

5.4 Equipment

WVU request funding for purchasing miniature ambient air sensors along with necessary data acquisition hardware and components needed for telemetry. In addition, WVU requests the purchase of a Teledyne, model BME400E ozone analyzer as lab-grade reference instrument for miniature sensor model development and linearization checks.

Table 6: Summary of cost for required equipment

Category	Year 1	Year 2	Year 3
Sensor supplies	$ 6,000	-	-
Telemetry Data Acquisition	$ 6,000	-	-
Teledyne BME400E Ozone analyzer	$ 10,000		

5.5 Supplies

Supplies purchase estimates are based upon vendor estimates and prior purchase experience, and cover laboratory and office supplies required to efficiently and successfully meet proposed goals.

5.6 Repairs and Alterations

No repairs and alterations are expected in this study.

5.7 Contractual

No contractual funding is estimated for this project.

5.8 Other Direct Costs

No additional direct costs are being proposed for this program.
DRI will be provided the sub award in this proposed study. DRI will perform the bulk of the modeling activities proposed in the study during the Year 2 and Year 3 of the project. The first year of the proposed work will involve DRI and WVU working closely with data collection, analysis and pollutant concentration maps prediction.
MARIN will be provided the sub award during Year 2 of this study to provide training to fleet operators selected for installation and operation of *AirCom* sensor units. MARIN will further engage and coordinate community organizations including SCAQMD and CARB during Year 2.

5.9 Indirect Costs

The U.S. Department of Health and Human Services is West Virginia University and West Virginia University Research Corporation's "cognizant agency" for negotiating facilities and

administration (F&A) and Fringe Benefits rates to be charged on all sponsored agreements. The activities proposed herein are predominantly off-campus in nature, and have an applied F&A rate of 26%. F&A Rates are only applied to the first $25,000 of any subcontract award.

Table 7: Summary of Program Direct and Indirect Costs.

	Year 1	Year 2	Year 3	Program
Direct	255,270	121,893	79,662	456,825
Indirect	40,093	27,158	9,678	76,929
Yearly and Program Total	**295,363**	**149,051**	**89,340**	**533,754**

5.10 Sub award Budget Justification

General: The methods used in estimating the costs for this proposal are consistent with those used in other projects of this type and are consistent with DRI's governing Federal cost principles, OMB A-122.

Salaries: The Desert Research Institute (DRI) is a non-profit research institution of higher education. Monthly rates are based on current actual salaries with a 5% increase for annual merit and cost of living adjustment for the future project years. Funding is requested for: Dr. John Mejia to manage the project, modeling integrations, and simulated output analyses; Mr. Travis McCord (Programmer) to support the modeling infrastructure; and a PhD level graduate research assistant (GRA) who will be responsible for constructing and managing the databases. GRA dissertation will be derived from these proposed research goals.

Fringe Benefits: The fringe benefit rate is 46.6% for professional employees, 50.3% for technologist, and 21.1% for graduate students. Rates are negotiated and approved annually by the U.S. Department of Health and Human Services. DRI uses a fringe benefit rate, which is applied to salaries for both budgeting and charging purposes for research projects. The benefits that are included in the rate are FICA, health insurance, vacation, sick leave, unemployment, grant-in-aid, disability insurance, Medicare, and retirement plan.

Travel: All per diem rates are based on the GSA Federal Travel Regulations, airfare rates are based on 7-21 day advance coach-class, and vehicle rental rates are based on contracted rates for State of Nevada agencies. Funding is requested for PI to travel to WVU for project collaboration in Years 2-3. In addition, funding for one domestic conference per year (American Geophysical Union fall meeting or American Meteorological Society meeting) is requested in Year 2-3.

Equipment: No cost for equipment is estimated for this project.

Other Direct Costs: Funding is requested for computers and a group workshop.

Indirect Costs: Indirect cost rates are negotiated and approved by the U.S. Department of Health and Human Services. The current provisional indirect cost rate for federal projects is 66.5% effective 07/01/2013. Indirect cost has been applied to modified total direct cost (excludes equipment and sub-awards in excess of $25,000). If awarded by USDA/NIFA, a revised budget will be submitted with the 30% indirect cost limitation.

IV. Synergistic Activities

1. Co-principal investigator in funded programs that have contributed to policy making and refinement of emissions inventory of regulatory agencies such as South Coast Air Quality Management District and the California Air Resources Board.
2. Supervising and mentoring a large group of undergraduate and graduate (Ph.D. and M.S)

students pursuing research in CAFEE.

3. Development of a database for the dissemination of emissions inventory of a large population heavy-duty vehicles characterized by different fuels, vocation and engine technology.
4. Development of a web based portal for continuous tracking of ambient and vehicle pollution through mobile on-board communication system.

Research Experience

For over 15 years, Mr. Carder has specialized in the measurement of emissions from heavy-duty diesel engines and alternative fuels research at West Virginia University. He has served in the capacity of Design Engineer, Project Manager, Co-Principal Investigator, and Principal Investigator on funded research projects totaling over $70 million dollars; most of it through the Center for Alternative Fuels, Engines and Emissions (CAFEE). Project sponsors include: US Army, US DOE, United Stated Postal Service, South Coast AQMD, multiple engine manufacturers with oversight from the US EPA, Miami Dade Transit, Oak Ridge National Laboratory, ARDEC (through Imperial Machine Tool), US DOT, DHHS, CDC, NIOSH (NIH - RO1), CARB, Coordinating Research Council, State of West Virginia, and other State and Federal agencies, as well as various industrial entities. His project responsibilities have been very diverse in nature, ranging from project proposal formulation to design and proof-of concept. Mr. Carder is currently serving as Interim Director of West Virginia University's Center for Alternative Fuels Engines and Emissions.

Marc C. Besch
Graduate Research Assistant
West Virginia University, 279 Engineering Sciences Building Addition, Morgantown, WV 26506-6106

"Demonstration of Advanced Diesel Emission Control System (ADECS) in Low-Sulfur Diesel-Fueled Heavy-Duty Engines," South Coast AQMD, Sep. 1, 2006 - Aug. 1, 2008, Diamond Bar, CA.

Relevant Research Activities

Participation in emission measurement, performance and research work at the Engine & Emissions Research Laboratory (EERL) including, but not limited to following studies:

- Development and evaluation of an advanced diesel emissions control system (ADECS) for ultra low-sulfur diesel fueled heavy duty engines including design of experiment (DOE) techniques and statistical methods to optimize engine calibration as well as aftertreatment component integration targeting US 2010 HDD emission standards.
- Performance measurement of catalyzed as well as non-catalyzed diesel particulate filters.
- Performance and emissions characterization from HDD engines fueled with fuel-born catalyst additives.
- Characterization of regulated and unregulated emissions form 2010 compliant HD-CNG equipped transit busses mounted on a chassis dynamometer.
- Performance and emissions characterization from a H_2-Enriched Heavy-Duty Diesel Engine
- Effects of different gas (CNG with varying H_2 content) fuels on the engine operation with increased compression ratio on a two-cylinder gasoline research engine.

Synergistic Activities

Current research focus involves the development of a regional climate modeling framework and using Weather Research Forecasting Model (WRF) and Community Climate System Model (CCSM) to study the impacts of the global and regional aspects of Climate change over the complex terrain, and source identification related to systematic errors in climate models.

Extensive experience in managing, developing, and adapting multi-dimensional and ensemble forecasting models, observational and model data processing, data assimilation, and in the research areas of improvement in numerical weather forecasting, renewable energy, and air dispersion. Experience operating atmospheric models to investigate atmospheric dynamics and cloudiness in coastal regions; real-time weather forecasting; atmospheric flows over complex terrain; and evaluation methods applied to atmospheric models using aircraft and satellite data;

Professor for the Atmospheric Science Graduate program, University of Nevada, Reno, NV; courser taught include Climate Modeling, Atmospheric Modeling, Applied Data Analysis, Atmospheric Turbulence, Mesoscale Modeling.

NASA Climate Impacts Investigator and Awardee of the NASA Group Achievement Award (2008). Outstanding accomplishment through the coordination of the NASA African Monsoon Multidisciplinary Analyses (NAMMA). Also, two times winner in the first place: National Award in Environmental Sciences, Fundación Alejandro Angel Escobar.

8 Guidelines, Limitations, and Additional Requirements

8.1 Letters of Intent/Letters of Support

Mid Atlantic Research Institute, Nevada (MARIN) has provided a letter of support which is included on the following page. MARIN will work as community coordinator between the proposing team of PI and Co-PI's and community organizations including SCAQMD and CARB. Furthermore, MARIN will foster partnership between fleet operators and community leaders, and provide necessary training sessions about in-field operation of *AirCom* sensor units.

8.2 Funding Opportunity Number

The proposing team is applying for the regular award Funding Opportunity Number (FON), **Air Pollution Monitoring for Communities, EPA-G2014-STAR-K1.**

8.3 Confidentiality

By submitting an application in response to this solicitation, the proposing team has agreed to grant the EPA permission to make limited disclosures of the application to technical reviewers both within and outside the Agency for the express purpose of assisting the Agency with evaluating the application. No claim of confidentiality for any portion of this proposal package has been made.

8.4 Human Subjects Research Statement

The proposed research does not involve human subjects.

MARIN LLC
3170 Vista Lucci
Reno, NV 89519

October 5, 2014

Dr. Arvind Thiruvengadam
Department of Mechanical and Aerospace Engineering
West Virginia University
Morgantown, WV 26506

Dear Professor Thiruvengadam:

MARIN, LLC is excited at the opportunity to work with you and your team at West Virginia University. We are very supportive of your proposal entitled, "Development of a Mobile Air Quality Sensor Network System". It's very encouraging to note that you are taking full advantage of the recent advances in sensor network technology and communications and linking them your world-renown expertise to capture a desperately needed picture of emissions and the air-quality in our communities.

The team at MARIN has worked for years with SCAQMD and CARB to mitigate emissions from heavy-duty vehicles and improve air quality. MARIN will help establish and foster partnerships with fleets, vehicle operators, and community leaders to raise awareness of the current air quality challenges in non-attainment regions, highlight shortcomings of current stationary air quality monitoring stations and discuss the basic principles of various sensing technologies for criteria air pollutants. MARI will provide training sessions to vehicle fleets on all of the above.

Again, please feel free to contact me if you need additional information. We wish you all the best with your proposal.

Thank you and regards,

Seema Gautam

White House: Paris deal needs to 'ratchet up' commitments over time

By Kevin Rogers

The Obama administration on Monday launched a full-court press for an international climate deal, as top administration officials said the United Nations-sponsored talks needed to reach an agreement that strengthens nations' pollution-curbing commitments over time.

At a White House climate summit, officials also announced commitments from major corporations to support a strong deal emerging from negotiations scheduled for December in

Paris, and to cut their own emissions as well.

State Department Special Envoy for Climate Change Todd Stern, while upbeat about the prospects of a Paris agreement, said that countries have not made commitments strong enough to adequately restrain the rise in global temperatures, so any agreement must have a mechanism for getting stricter over time.

"We have proposed and pushed the idea of successive rounds of targets, so you keep ratcheting ambition up. The first round of targets is hugely significant," he said. "They're very good, but they're not enough. What we need is a multi-part package for ambition, successive rounds of ratcheting up targets over time [and] long-term targets as well."

Stern, the top U.S. negotiator in Paris, cited Climate Action Tracker, a climate data group, which projects that the current national pledges would keep the rise in global temperatures to 2.7 degrees Celsius above pre-industrial levels. The goal of the UN talks is to limit that rise to 2 degrees, the point where many scientists believe the most severe impacts would become irreversible. The Intergovernmental Panel on Climate Change projects that the world could hit that point by 2050, absent strong action to cut greenhouse gas emissions.

The U.S., for its part, has pledged to cut overall emissions to 26 to 28 percent below 2005 levels, and to achieve that goal by 2025. The administration said it would do so through power plant carbon regulations, fuel efficiency standards, oil and gas methane emissions rules, and improved energy efficiency.

Private-sector support for a strong deal was announced in connection with a roundtable with business executives and President Barack Obama. Some 81 companies — including Apple, Berkshire Hathaway Energy, and Google — pledged to cut their carbon emissions and expand renewable energy investment.

"The perception is that this is an environmental issue, it's for tree huggers, and that hard-headed businesspeople either don't care about it or see it as a conflict with their bottom lines," Obama said. "This conversation has confirmed what we've known for quite some time, which is that considerations of climate change, energy efficiency, renewable energies are not only not contradictory to their bottom lines, but for these companies, they're discovering that they can enhance their bottom lines."

"We support the conclusion of a climate change agreement in Paris that takes a strong step forward toward a low-carbon, sustainable future," the companies pledged. "We recognize that delaying action on climate change will be costly in economic and human terms, while accelerating the transition to a low-carbon economy will produce multiple benefits with regard to sustainable economic growth, public health, resilience to natural disasters, and the health of the global environment."

The United Nations talks are the topic of a Tuesday Senate Foreign Relations subcommittee hearing, where Stern is slated to testify on the U.S. commitment.

Chairman Sen. Bob Corker, R-Tenn., has already pressed Stern on the administration's approach to the negotiations, including whether the agreement would be in the form of a treaty subject to Senate ratification. He contended that, since the United Nations Framework Convention on Climate Change and the Kyoto Protocol were submitted for congressional approval, any deal from Paris should be as well.

Many of Corker's colleagues, including Senate Majority Leader Mitch McConnell, R-Ky., have vowed to find a legislative channel to block a climate deal or U.S. commitment.

Tom Pyle, president of the free market group American Energy Alliance, said the administration's decision on whether to pursue a treaty or some other form of agreement will be critical.

"The lead-up to this treaty is all backdrop and photo-ops from my perspective, especially if they're not going to submit it to the Senate," he said. "The next person that comes in can just basically undo it with the stroke of a pen. I'm not sure what they're going to ultimately achieve in terms of anything meaningful out of Paris."

But Stern and other White House officials were all optimism Monday, especially because, they say, India, Brazil and China have put substantial commitments on the table. Stern called it a "fundamental pivot" for global climate policy.

"We are uniquely positioned like we never have been as a global community, but we have a lot of work today," White House Senior Adviser Brian Deese said. "Taken together, we now have 150 countries that have submitted their official contributions to the UN process. That represents more than 85 percent of global emissions. That, in and of itself, reflects success."

Upcoming Events

Tests underway after fire put out at radioactive waste site

By Sally Ho and Ken Ritter

LAS VEGAS (AP) — A contractor from the former nuclear weapons testing site in Nevada joined several state agencies checking air quality and monitoring for other problems Monday following a fire at a radioactive waste disposal site in rural southern Nevada.

No injuries were reported after the fire, which began Sunday afternoon in an industrial area near Beatty, Nevada, about 115 miles northwest of Las Vegas, said Bud Marshall, southern Nevada regional supervisor for the state Division of Emergency Management and Homeland Security.

It was not clear how the fire started at the shuttered disposal site, which is about 8 miles from populated areas. Authorities say it closed in 1992 after accepting low-level radioactive waste for 30 years, which typically can include tools, protective clothing, and parts and machinery from nuclear plants.

A fixed-wing aircraft and a helicopter from the former Nevada Test Site were flying

radiation detection equipment over and around the area, Nevada National Security Site spokesman Darwin Morgan said. The results were being turned over to state officials, he said.

More

Upcoming nuke plant closure could roil New England energy markets

By Stephen Singer

HARTFORD, Conn. (AP) — The impending retirement of Massachusetts' only nuclear power plant could roil energy markets across New England, leading to greater reliance on natural gas, driving up carbon emissions and putting more pressure on pipelines already facing bottlenecks.

Pilgrim Nuclear Power Station, the only nuclear power plant in Massachusetts, announced last week it will close by June 2019 because it's becoming too expensive to run. Two other nuclear plants operate in New England, at Seabrook Nuclear Power Plant in New Hampshire and Millstone Power Station in Connecticut.

"We're concerned about the apparent enthusiasm around the states for a leap to fill this void with natural gas plants," said Greg Cunningham, of the Conservation Law Foundation, an environmental advocacy group. "It's heading us in the wrong direction."

States have set low-carbon emissions caps in law and will have to find ways to meet those goals after Pilgrim goes dark. Massachusetts Gov. Charlie Baker said the shutdown of Pilgrim will be a "significant loss of carbon-free electricity generation" and will undermine the state's progress in achieving greenhouse gas emission reduction goals.

Lawsuits could force VW to buy back cheating diesels

By Tom Krisher

DETROIT (AP) — Volkswagen almost inevitably will have to compensate owners of diesel cars equipped with emissions-rigging software. Some legal experts say the automaker could be forced to buy back the cars altogether.

Many of the more than 200 lawsuits filed in the past few weeks allege that for seven years VW marketed four-cylinder diesel Golfs, Jettas, Beetles and Passats as clean alternatives to

gas engines, knowing all along that the cars were spewing pollution that far exceeded legal limits.

In September, Volkswagen admitted to rigging emissions tests in the U.S. Earlier this month, Michael Horn, the head of its U.S. operations, told a congressional panel that VW was considering compensating owners for the lost value of their cars. He also said that it could take from one to two years to fix all the affected cars.

Seattle lawyer Steve Berman seized on that time frame when he sued VW last week in Los Angeles, seeking full restitution for owners of nearly 70,000 affected cars in California.

More

Ohio River's huge algae bloom a warning for water suppliers

By John Seewer, The Associated Press

A toxic algae outbreak that snaked more than 600 miles down the Ohio River past four states is forcing water utilities to reassess the threat from harmful algal blooms that are popping up increasingly around the nation.

Treatment plant operators and researchers along the river were surprised by the large bloom and said it should be a warning to cities that get their water supply from lakes, rivers and manmade reservoirs.

"You need to be ready and have a plan in place," said Roger Tucker, who monitors algae sampling for the Louisville Water Co. in Kentucky. "The Ohio River is proof of that."

The bloom appears to be winding down now, two months after being detected in the middle of August. It made its way from Wheeling, West Virginia, and past Cincinnati and Louisville, setting off warnings about boating and fishing in the river. Organizers canceled a swim from Cincinnati to northern Kentucky.

More

Oil collapse gives US colleges a test on backpedaling donors

By Paul J. Weber

AUSTIN, Texas (AP) — It's easy to see what oil money means to the University of Texas. Tuition hasn't budged in three years because of gushing wells in the Permian Basin. More than a few buildings, including the football team headquarters, are named after wildcatters,

and a pump jack stands outside the 100,000-seat stadium to commemorate the 1920s oil boom.

But the latest bust and tumbling crude prices are now pinching off the largesse that helps this university and others in oil-rich states afford what they want when state budgets are straitened, which is especially the case now. Already, the consequences are becoming obvious.

Campus construction projects are being stretched out or put in limbo, scholarship funds are taking a hit and across the Southwest, donors are asking for more time to make good on big pledges.

"When the price of oil was $100 a barrel we had a lot more gifts. They had the ability to make more gifts," said Bob Walker, who raised hundreds of millions of dollars for Texas A&M University for three decades before retiring last year.

Pope rallies bishops to press climate call before Paris meet

By The Associated Press

VATICAN CITY (AP) — The Vatican is seeking to reinforce Pope Francis' environmental message by encouraging bishops from around the world to sign an appeal to world leaders meeting in Paris next month for crucial climate change talks.

Cardinals, patriarchs and bishops, including representatives of regional bishops' conferences from Asia, Africa, Latin America and Oceania, are expected to sign the appeal Monday.

Francis outlined his eco-message in a major teaching document in June, denouncing what he called the "structurally perverse" fossil fuel-based world economy that he says exploits the poor and destroys the Earth.

The encyclical was cheered by environmentalists and ignored or criticized by big business interests. In the U.S., it was met with particular unease and so far no U.S. bishop is scheduled to participate in the conference to launch the appeal.

Czech Republic to expand brown coal mining program

By The Associated Press

PRAGUE (AP) — The Czech government has approved a plan to expand the mining of lignite, a fossil fuel known as brown coal.

Despite protests from environmentalists and local citizens, the government is allowing the mining to expand beyond previously set limits to get access to up to 120 million metric tons of coal in the northwest of the country.

The limits were set in 1991 to prevent environmental damage as brown coal is a major source of greenhouse gases.

Trade and Industry Minister Jan Mladek says the coal is needed to secure the country's energy supply.

More

Global Witness: How 4 African countries lost $4 billion

By The Associated Press

LAGOS, Nigeria (AP) — A watchdog group says four African countries lost more than $4 billion in shady oil and mining deals and calls for the Extractive Industries Transparency Initiative to police the hidden ownership of companies used for such corruption.

Global Witness details contracts in Nigeria, Angola, Republic of Congo and the Democratic Republic of Congo and "lays bare how anonymous companies facilitate the loss of national wealth on an epic scale."

The report questions the role of international oil companies that facilitate such deals.

Global Witness says the transparency group faces "a credibility test" when its board meets in Switzerland this week to decide whether to make disclosure of true owners a membership condition.

White House: Paris deal needs to 'ratchet up' commitments over time

By Kevin Rogers

The Obama administration on Monday launched a full-court press for an international climate deal, as top administration officials said the United Nations-sponsored talks needed to reach an agreement that strengthens nations' pollution-cutting commitments over time.

At a White House climate summit, officials also announced commitments from major corporations to support a strong deal emerging from negotiations scheduled for December in

Paris, and to cut their own emissions as well.

State Department Special Envoy for Climate Change Todd Stern, while upbeat about the prospects of a Paris agreement, said that countries have not made commitments strong enough to adequately restrain the rise in global temperatures, so any agreement must have a mechanism for getting stricter over time.

"We have proposed and pushed the idea of successive rounds of targets, so you keep ratcheting ambition up. The first round of targets is hugely significant," he said. "They're very good, but they're not enough. What we need is a multi-part package for ambition, successive rounds of ratcheting up targets over time [and] long-term targets as well."

Stern, the top U.S. negotiator in Paris, cited Climate Action Tracker, a climate data group, which projects that the current national pledges would keep the rise in global temperatures to 2.7 degrees Celsius above pre-industrial levels. The goal of the UN talks is to limit that rise to 2 degrees, the point where many scientists believe the most severe impacts would become irreversible. The Intergovernmental Panel on Climate Change projects that the world could hit that point by 2050, absent strong action to cut greenhouse gas emissions.

The U.S., for its part, has pledged to cut overall emissions to 26 to 28 percent below 2005 levels, and to achieve that goal by 2025. The administration said it would do so through power plant carbon regulations, fuel efficiency standards, oil and gas methane emissions rules, and improved energy efficiency.

Private-sector support for a strong deal was announced in connection with a roundtable with business executives and President Barack Obama. Some 81 companies — including Apple, Berkshire Hathaway Energy, and Google — pledged to cut their carbon emissions and expand renewable energy investment.

"The perception is that this is an environmental issue, it's for tree huggers, and that hard-headed businesspeople either don't care about it or see it as a conflict with their bottom lines," Obama said. "This conversation has confirmed what we've known for quite some time, which is that considerations of climate change, energy efficiency, renewable energies are not only not contradictory to their bottom lines, but for these companies, they're discovering that they can enhance their bottom lines."

"We support the conclusion of a climate change agreement in Paris that takes a strong step forward toward a low-carbon, sustainable future," the companies pledged. "We recognize that delaying action on climate change will be costly in economic and human terms, while accelerating the transition to a low-carbon economy will produce multiple benefits with regard to sustainable economic growth, public health, resilience to natural disasters, and the health of the global environment."

The United Nations talks are the topic of a Tuesday Senate Foreign Relations subcommittee hearing, where Stern is slated to testify on the U.S. commitment.

Chairman Sen. Bob Corker, R-Tenn., has already pressed Stern on the administration's approach to the negotiations, including whether the agreement would be in the form of a treaty subject to Senate ratification. He contended that, since the United Nations Framework Convention on Climate Change and the Kyoto Protocol were submitted for congressional approval, any deal from Paris should be as well.

Many of Corker's colleagues, including Senate Majority Leader Mitch McConnell, R-Ky., have vowed to find a legislative channel to block a climate deal or U.S. commitment.

Tom Pyle, president of the free market group American Energy Alliance, said the administration's decision on whether to pursue a treaty or some other form of agreement will be critical.

"The lead-up to this treaty is all backdrop and photo-ops from my perspective, especially if they're not going to submit it to the Senate," he said. "The next person that comes in can just basically undo it with the stroke of a pen. I'm not sure what they're going to ultimately achieve in terms of anything meaningful out of Paris."

But Stern and other White House officials were all optimism Monday, especially because, they say, India, Brazil and China have put substantial commitments on the table. Stern called it a "fundamental pivot" for global climate policy.

"We are uniquely positioned like we never have been as a global community, but we have a lot of work today," White House Senior Adviser Brian Deese said. "Taken together, we now have 150 countries that have submitted their official contributions to the UN process. That represents more than 85 percent of global emissions. That, in and of itself, reflects success."

Tests underway after fire put out at radioactive waste site

By Sally Ho and Ken Ritter

LAS VEGAS (AP) — A contractor from the former nuclear weapons testing site in Nevada joined several state agencies checking air quality and monitoring for other problems Monday following a fire at a radioactive waste disposal site in rural southern Nevada.

No injuries were reported after the fire, which began Sunday afternoon in an industrial area near Beatty, Nevada, about 115 miles northwest of Las Vegas, said Bud Marshall, southern Nevada regional supervisor for the state Division of Emergency Management and Homeland Security.

It was not clear how the fire started at the shuttered disposal site, which is about 8 miles from populated areas. Authorities say it closed in 1992 after accepting low-level radioactive waste for 30 years, which typically can include tools, protective clothing, and parts and machinery from nuclear plants.

A fixed-wing aircraft and a helicopter from the former Nevada Test Site were flying

radiation detection equipment over and around the area, Nevada National Security Site spokesman Darwin Morgan said. The results were being turned over to state officials, he said.

Upcoming nuke plant closure could roil New England energy markets

By Stephen Singer

HARTFORD, Conn. (AP) — The impending retirement of Massachusetts' only nuclear power plant could roil energy markets across New England, leading to greater reliance on natural gas, driving up carbon emissions and putting more pressure on pipelines already facing bottlenecks.

Pilgrim Nuclear Power Station, the only nuclear power plant in Massachusetts, announced last week it will close by June 2019 because it's becoming too expensive to run. Two other nuclear plants operate in New England, at Seabrook Nuclear Power Plant in New Hampshire and Millstone Power Station in Connecticut.

"We're concerned about the apparent enthusiasm around the states for a leap to fill this void with natural gas plants," said Greg Cunningham, of the Conservation Law Foundation, an environmental advocacy group. "It's heading us in the wrong direction."

States have set low-carbon emissions caps in law and will have to find ways to meet those goals after Pilgrim goes dark. Massachusetts Gov. Charlie Baker said the shutdown of Pilgrim will be a "significant loss of carbon-free electricity generation" and will undermine the state's progress in achieving greenhouse gas emission reduction goals.

Lawsuits could force VW to buy back cheating diesels

By Tom Krisher

DETROIT (AP) — Volkswagen almost inevitably will have to compensate owners of diesel cars equipped with emissions-rigging software. Some legal experts say the automaker could be forced to buy back the cars altogether.

Many of the more than 200 lawsuits filed in the past few weeks allege that for seven years VW marketed four-cylinder diesel Golfs, Jettas, Beetles and Passats as clean alternatives to

gas engines, knowing all along that the cars were spewing pollution that far exceeded legal limits.

In September, Volkswagen admitted to rigging emissions tests in the U.S. Earlier this month, Michael Horn, the head of its U.S. operations, told a congressional panel that VW was considering compensating owners for the lost value of their cars. He also said that it could take from one to two years to fix all the affected cars.

Seattle lawyer Steve Berman seized on that time frame when he sued VW last week in Los Angeles, seeking full restitution for owners of nearly 70,000 affected cars in California.

Ohio River's huge algae bloom a warning for water suppliers

By John Seewer, The Associated Press

A toxic algae outbreak that snaked more than 600 miles down the Ohio River past four states is forcing water utilities to reassess the threat from harmful algal blooms that are popping up increasingly around the nation.

Treatment plant operators and researchers along the river were surprised by the large bloom and said it should be a warning to cities that get their water supply from lakes, rivers and manmade reservoirs.

"You need to be ready and have a plan in place," said Roger Tucker, who monitors algae sampling for the Louisville Water Co. in Kentucky. "The Ohio River is proof of that."

The bloom appears to be winding down now, two months after being detected in the middle of August. It made its way from Wheeling, West Virginia, and past Cincinnati and Louisville, setting off warnings about boating and fishing in the river. Organizers canceled a swim from Cincinnati to northern Kentucky.

Oil collapse gives US colleges a test on backpedaling donors

By Paul J. Weber

AUSTIN, Texas (AP) — It's easy to see what oil money means to the University of Texas. Tuition hasn't budged in three years because of gushing wells in the Permian Basin. More than a few buildings, including the football team headquarters, are named after wildcatters,

and a pump jack stands outside the 100,000-seat stadium to commemorate the 1920s oil boom.

But the latest bust and tumbling crude prices are now pinching off the largesse that helps this university and others in oil-rich states afford what they want when state budgets are straitened, which is especially the case now. Already, the consequences are becoming obvious.

Campus construction projects are being stretched out or put in limbo, scholarship funds are taking a hit and across the Southwest, donors are asking for more time to make good on big pledges.

"When the price of oil was $100 a barrel we had a lot more gifts. They had the ability to make more gifts," said Bob Walker, who raised hundreds of millions of dollars for Texas A&M University for three decades before retiring last year.

Pope rallies bishops to press climate call before Paris meet

By The Associated Press

VATICAN CITY (AP) — The Vatican is seeking to reinforce Pope Francis' environmental message by encouraging bishops from around the world to sign an appeal to world leaders meeting in Paris next month for crucial climate change talks.

Cardinals, patriarchs and bishops, including representatives of regional bishops' conferences from Asia, Africa, Latin America and Oceania, are expected to sign the appeal Monday.

Francis outlined his eco-message in a major teaching document in June, denouncing what he called the "structurally perverse" fossil fuel-based world economy that he says exploits the poor and destroys the Earth.

The encyclical was cheered by environmentalists and ignored or criticized by big business interests. In the U.S., it was met with particular unease and so far no U.S. bishop is scheduled to participate in the conference to launch the appeal.

Czech Republic to expand brown coal mining program

By The Associated Press

PRAGUE (AP) — The Czech government has approved a plan to expand the mining of lignite, a fossil fuel known as brown coal.

Despite protests from environmentalists and local citizens, the government is allowing the mining to expand beyond previously set limits to get access to up to 120 million metric tons of coal in the northwest of the country.

The limits were set in 1991 to prevent environmental damage as brown coal is a major source of greenhouse gases.

Trade and Industry Minister Jan Mladek says the coal is needed to secure the country's energy supply.

Global Witness: How 4 African countries lost $4 billion

By The Associated Press

LAGOS, Nigeria (AP) — A watchdog group says four African countries lost more than $4 billion in shady oil and mining deals and calls for the Extractive Industries Transparency Initiative to police the hidden ownership of companies used for such corruption.

Global Witness details contracts in Nigeria, Angola, Republic of Congo and the Democratic Republic of Congo and "lays bare how anonymous companies facilitate the loss of national wealth on an epic scale."

The report questions the role of international oil companies that facilitate such deals.

Global Witness says the transparency group faces "a credibility test" when its board meets in Switzerland this week to decide whether to make disclosure of true owners a membership condition.

Markey presses NRC on nuclear fleet's climate resilience

By Kevin Rogers

A week after he welcomed the announcement that his home-state Pilgrim Nuclear Power Station would shut down by 2019, Massachusetts Sen. Ed Markey is pressing the federal government to detail the climate resilience of the rest of the nuclear fleet.

In a letter sent Monday to Nuclear Regulatory Commission Chairman Stephen Burns, the Massachusetts Democrat raised concerns that the nation's nuclear plants might be at risk as

climate impacts worsen and extreme weather events become more frequent.

"I write to request information about how extreme weather, higher water temperatures, and the effects of climate change may impact the U.S. nuclear power industry in light of the increase in the number of plant shutdowns," he wrote.

"Other extreme weather events have also threatened the safe operation of U.S. nuclear power plants, including tornado outbreaks, hurricanes, and droughts," he continued.

Markey called on Burns to supply him with data on any nuclear shutdown or power reduction in the past decade that came as a result of flooding, hurricanes and other extreme weather events, as well as how much generating capacity was lost as a result of the shutdowns.

A spokesperson for NRC said that Burns would respond appropriately and offered no additional comment.

Markey also raised concerns that warming water temperatures could force additional plant shutdowns and generation reductions reductions.

"Rising water temperatures, exacerbated by global warming, have also directly impacted nuclear power plants," he said.

Currently, NRC regulations allow nuclear plants to intake water 75 degrees Fahrenheit or lower for cooling operations, with the option to seek permission to bring in water as warm as 80 degrees.

Markey noted that the Pilgrim plant had to shut down four times in the past three years due to warmer-than-legal temperatures in Cape Cod Bay. He warned that the Entergy-owned plant's problems could be emblematic of a larger climate issue facing the nuclear fleet.

"This and past actions at other reactors may signal that plant operators believe that partial or full shutdowns may become regular occurrences," he said. "As the risk of elevated water temperatures continue to rise, so will the risk of nuclear power plant full or partial shutdowns."

Markey believes nuclear energy to be a high-cost, high-risk venture, despite its status as a zero-emitting source of electricity. In response to the announcement that the Pilgrim plant would shut down last week, Markey urged his state to work to replace it with renewable power.

A spokesperson for the Nuclear Energy Institute, the nuclear industry's advocacy group, did not return a request for comment on Markey's letter and concerns. NEI, however, contends that nuclear plants are highly resilient to extreme weather, especially in Markey's region.

"New Englanders are no strangers to extreme weather," NEI President Marvin Fertel said in

response to last week's Pilgrim announcement. "Over the years, with rare exception, nuclear energy facilities have supported the area by reliably providing the electricity that can be the difference between life and death."

States probe VW over emissions, look for settlement

money

By Ronnie Greene and Ryan J. Foley

WASHINGTON (AP) — An expanding investigation into Volkswagen's emissions-cheating scandal launched by state attorneys general could last years and will likely end in a negotiated settlement.

Forty-five states and D.C. have joined the review, investigating how VW was able to game emissions tests to hide that its "Clean Diesel" cars emitted smog-causing exhaust up to 40 times dirtier than the law allows. The attorneys general are likely to seek compensation for consumers and redress for environmental harm, building their own investigations under state laws that protect consumers from deceptive trade practices and set clean air standards.

"This is a really important case and it has big economic and health consequences. It's nowhere near the scale of tobacco but you are kind of in that realm," said former Wisconsin governor and attorney general Jim Doyle, who participated in the multistate investigation that ended in a landmark settlement against tobacco companies in 1998. "This is the kind of case that you elect an AG for, to stand up for the safety and health of the people of the state."

Volkswagen is "looking at an enormous settlement, just enormous, when you think about how many cars are out there," he said.

More

Son of late PM Pierre Trudeau becomes Canada's new leader

By Rob Gillies

TORONTO (AP) — Canadians voted for a sharp change in their government Monday, returning a legendary name for liberals, Trudeau, to the prime minister's office and resoundingly ending Conservative Stephen Harper's near-decade in office.

Justin Trudeau, the son of late Prime Minister Pierre Trudeau, became Canada's new prime minister after his Liberal Party won a majority of Parliament's 338 seats. Trudeau's Liberals had been favored to win the most seats, but few expected the final margin of victory.

Canada had shifted to the center-right under Harper, who has lowered sales and corporate taxes, avoided climate change legislation and clashed with the Obama administration over the Keystone XL pipeline.

The Trudeau victory will ease tensions with the U.S. Although Trudeau supports the

Keystone pipeline, he argues relations should not hinge on the project. Harper has clashed with the Obama administration over other issues, including the recently reached Iran nuclear deal.

"Tonight Canada is becoming the country it was before," Trudeau said. And he added that positive politics led to his victory.

Monitors arrive after radioactive waste site fire in Nevada

By Sally Ho and Ken Ritter

LAS VEGAS (AP) — Radiation wasn't immediately detected during fly-overs of a burned trench containing long-buried radioactive waste at a commercial disposal site in rural southern Nevada, state and federal officials said Monday.

Ground testing was scheduled next, headed by a U.S. Environmental Protection Agency radiological emergency team sent to the site about 115 miles northwest of Las Vegas, said Rusty Harris-Bishop, spokesman for the EPA Region 9 office in San Francisco.

"No gamma radiation has been detected at this time," Harris-Bishop said in a statement announcing the federal agency was joining a damage and danger assessment headed by the state and involving the Nevada National Guard, Nye County officials and U.S. Energy Department.

The EPA said the unknown amount of low-level radioactive waste that burned had been

deposited sometime in the 30 year-period before 1992, when facility operator US Ecology stopped accepting such material. It was one of six in the nation that accepted low-level radioactive waste, which typically includes tools, protective clothing, and parts and machinery from nuclear plants.

More workers testify on mine conditions in ex-coal CEO trial

By The Associated Press

CHARLESTON, W.Va. (AP) — In ex-Massey Energy CEO Don Blankenship's trial, former mine supervisors testified about being pushed to produce more coal despite poor conditions underground before a deadly 2010 mine explosion.

Media outlets report that in Charleston federal court Monday, former section foreman Richard "Smurf" Hutchens recalled unrealistic coal production goals at Upper Big Branch Mine. He said a supervisor threatened to fire him if he didn't meet production goals, despite regularly being behind on cleaning up his section.

Former superintendent Rick Hodges and fire boss Larry Adams said Upper Big Branch never had enough workers to both produce coal and maintain safety.

Blankenship is charged with conspiring to break mine safety laws and lying to financial regulators about safety at the West Virginia mine, which exploded in 2010, killing 29 men.

A message from the American Petroleum Institute

America is now the world's #1 natural gas producer and will soon be #1 in oil. Now more than ever, abundant energy means abundant prosperity, opportunity and security for all Americans.

Dalai Lama calls action on climate a 'human responsibility'

By Katy Daigle

NEW DELHI (AP) — The Dalai Lama on Tuesday urged strong global action to limit global warming and to protect fragile environments, including the Himalayan glaciers and Tibetan plateau.

Calling climate change a "problem which human beings created," the 80-year-old Tibetan Buddhist spiritual leader said all of humanity was now responsible for taking action. But instead, he said, "we are relying on praying to God or to Buddha. Sometimes I feel this is very illogical."

He issued his plea in a pre-taped video released as part of a campaign launched by the Tibetan government-in-exile in the north Indian hill town of Dharmsala, where the Dalai Lama has been based since fleeing a Chinese military crackdown in Tibet.

The government-in-exile said the campaign would continue through this year's U.N. climate change talks, where nations hope to conclude a new treaty for limiting climate-warming gas emissions. The exiled government will also send its own delegate to the talks, which start Nov. 30 in Paris, though it will not have a vote of its own.

Markey presses NRC on nuclear fleet's climate resilience

By Kevin Rogers

A week after he welcomed the announcement that his home-state Pilgrim Nuclear Power Station would shut down by 2019, Massachusetts Sen. Ed Markey is pressing the federal government to detail the climate resilience of the rest of the nuclear fleet.

In a letter sent Monday to Nuclear Regulatory Commission Chairman Stephen Burns, the Massachusetts Democrat raised concerns that the nation's nuclear plants might be at risk as

climate impacts worsen and extreme weather events become more frequent.

"I write to request information about how extreme weather, higher water temperatures, and the effects of climate change may impact the U.S. nuclear power industry in light of the increase in the number of plant shutdowns," he wrote.

"Other extreme weather events have also threatened the safe operation of U.S. nuclear power plants, including tornado outbreaks, hurricanes, and droughts," he continued.

Markey called on Burns to supply him with data on any nuclear shutdown or power reduction in the past decade that came as a result of flooding, hurricanes and other extreme weather events, as well as how much generating capacity was lost as a result of the shutdowns.

A spokesperson for NRC said that Burns would respond appropriately and offered no additional comment.

Markey also raised concerns that warming water temperatures could force additional plant shutdowns and generation reductions reductions.

"Rising water temperatures, exacerbated by global warming, have also directly impacted nuclear power plants," he said.

Currently, NRC regulations allow nuclear plants to intake water 75 degrees Fahrenheit or lower for cooling operations, with the option to seek permission to bring in water as warm as 80 degrees.

Markey noted that the Pilgrim plant had to shut down four times in the past three years due to warmer-than-legal temperatures in Cape Cod Bay. He warned that the Entergy-owned plant's problems could be emblematic of a larger climate issue facing the nuclear fleet.

"This and past actions at other reactors may signal that plant operators believe that partial or full shutdowns may become regular occurrences," he said. "As the risk of elevated water temperatures continue to rise, so will the risk of nuclear power plant full or partial shutdowns."

Markey believes nuclear energy to be a high-cost, high-risk venture, despite its status as a zero-emitting source of electricity. In response to the announcement that the Pilgrim plant would shut down last week, Markey urged his state to work to replace it with renewable power.

A spokesperson for the Nuclear Energy Institute, the nuclear industry's advocacy group, did not return a request for comment on Markey's letter and concerns. NEI, however, contends that nuclear plants are highly resilient to extreme weather, especially in Markey's region.

"New Englanders are no strangers to extreme weather," NEI President Marvin Fertel said in

response to last week's Pilgrim announcement. "Over the years, with rare exception, nuclear energy facilities have supported the area by reliably providing the electricity that can be the difference between life and death."

States probe VW over emissions, look for settlement

money

By Ronnie Greene and Ryan J. Foley

WASHINGTON (AP) — An expanding investigation into Volkswagen's emissions-cheating scandal launched by state attorneys general could last years and will likely end in a negotiated settlement.

Forty-five states and D.C. have joined the review, investigating how VW was able to game emissions tests to hide that its "Clean Diesel" cars emitted smog-causing exhaust up to 40 times dirtier than the law allows. The attorneys general are likely to seek compensation for consumers and redress for environmental harm, building their own investigations under state laws that protect consumers from deceptive trade practices and set clean air standards.

"This is a really important case and it has big economic and health consequences. It's nowhere near the scale of tobacco but you are kind of in that realm," said former Wisconsin governor and attorney general Jim Doyle, who participated in the multistate investigation that ended in a landmark settlement against tobacco companies in 1998. "This is the kind of case that you elect an AG for, to stand up for the safety and health of the people of the state."

Volkswagen is "looking at an enormous settlement, just enormous, when you think about how many cars are out there," he said.

Son of late PM Pierre Trudeau becomes Canada's new leader

By Rob Gillies

TORONTO (AP) — Canadians voted for a sharp change in their government Monday, returning a legendary name for liberals, Trudeau, to the prime minister's office and resoundingly ending Conservative Stephen Harper's near-decade in office.

Justin Trudeau, the son of late Prime Minister Pierre Trudeau, became Canada's new prime minister after his Liberal Party won a majority of Parliament's 338 seats. Trudeau's Liberals had been favored to win the most seats, but few expected the final margin of victory.

Canada had shifted to the center-right under Harper, who has lowered sales and corporate taxes, avoided climate change legislation and clashed with the Obama administration over the Keystone XL pipeline.

The Trudeau victory will ease tensions with the U.S. Although Trudeau supports the

Keystone pipeline, he argues relations should not hinge on the project. Harper has clashed with the Obama administration over other issues, including the recently reached Iran nuclear deal.

"Tonight Canada is becoming the country it was before," Trudeau said. And he added that positive politics led to his victory.

Oil slips following big slide

By EnergyGuardian

Oil was lower early Tuesday following a big slide triggered in part by a fall in gasoline futures.

Benchmark U.S. crude for November delivery was down 11 cents to $46.17 per barrel in electronic trading on the New York Mercantile Exchange. On Monday, the contract fell $1.44 to $46.28.

Brent crude, used to price international oils, lost 10 cents to $48.50 in London. The December contract had plunged $1.85 to $48.61 in the previous session.

Monitors arrive after radioactive waste site fire in Nevada

By Sally Ho and Ken Ritter

LAS VEGAS (AP) — Radiation wasn't immediately detected during fly-overs of a burned trench containing long-buried radioactive waste at a commercial disposal site in rural southern Nevada, state and federal officials said Monday.

Ground testing was scheduled next, headed by a U.S. Environmental Protection Agency radiological emergency team sent to the site about 115 miles northwest of Las Vegas, said Rusty Harris-Bishop, spokesman for the EPA Region 9 office in San Francisco.

"No gamma radiation has been detected at this time," Harris-Bishop said in a statement announcing the federal agency was joining a damage and danger assessment headed by the state and involving the Nevada National Guard, Nye County officials and U.S. Energy Department.

The EPA said the unknown amount of low-level radioactive waste that burned had been

deposited sometime in the 30 year-period before 1992, when facility operator US Ecology stopped accepting such material. It was one of six in the nation that accepted low-level radioactive waste, which typically includes tools, protective clothing, and parts and machinery from nuclear plants.

More workers testify on mine conditions in ex-coal CEO trial

By The Associated Press

CHARLESTON, W.Va. (AP) — In ex-Massey Energy CEO Don Blankenship's trial, former mine supervisors testified about being pushed to produce more coal despite poor conditions underground before a deadly 2010 mine explosion.

Media outlets report that in Charleston federal court Monday, former section foreman Richard "Smurf" Hutchens recalled unrealistic coal production goals at Upper Big Branch Mine. He said a supervisor threatened to fire him if he didn't meet production goals, despite regularly being behind on cleaning up his section.

Former superintendent Rick Hodges and fire boss Larry Adams said Upper Big Branch never had enough workers to both produce coal and maintain safety.

Blankenship is charged with conspiring to break mine safety laws and lying to financial regulators about safety at the West Virginia mine, which exploded in 2010, killing 29 men.

A message from the American Petroleum Institute

America is now the world's #1 natural gas producer and will soon be #1 in oil. Now more than ever, abundant energy means abundant prosperity, opportunity and security for all Americans.

Dalai Lama calls action on climate a 'human responsibility'

By Katy Daigle

NEW DELHI (AP) — The Dalai Lama on Tuesday urged strong global action to limit global warming and to protect fragile environments, including the Himalayan glaciers and Tibetan plateau.

Calling climate change a "problem which human beings created," the 80-year-old Tibetan Buddhist spiritual leader said all of humanity was now responsible for taking action. But instead, he said, "we are relying on praying to God or to Buddha. Sometimes I feel this is very illogical."

He issued his plea in a pre-taped video released as part of a campaign launched by the Tibetan government-in-exile in the north Indian hill town of Dharmsala, where the Dalai Lama has been based since fleeing a Chinese military crackdown in Tibet.

The government-in-exile said the campaign would continue through this year's U.N. climate change talks, where nations hope to conclude a new treaty for limiting climate-warming gas emissions. The exiled government will also send its own delegate to the talks, which start Nov. 30 in Paris, though it will not have a vote of its own.

ENERGY MARKETS:

Supreme Court takes on another high-stakes FERC case

Robin Bravender, E&E reporter

Published: Monday, October 19, 2015

The Supreme Court today agreed to tackle its second major case of this term surrounding state and federal turf lines in electricity markets.

In a customary short order issued this morning, the court announced it would hear arguments in two linked cases involving a Maryland program providing incentives for new power generation. A lower court threw out the state program after judges found the incentives infringed on the Federal Energy Regulatory Commission's jurisdiction.

That program had been challenged by existing plants that would compete with the new plants in the regional wholesale electricity market operated by PJM Interconnection LLC. Power generators opposed to the state program and the Obama administration had urged the high court not to hear the appeal.

The high court is currently grappling with a separate case surrounding whether a FERC program inappropriately impeded on states' jurisdiction over retail electricity markets. An opinion in that case is pending after the justices heard oral arguments last week (*Greenwire*, Oct. 14).

The newly granted case is tied to the pending case "in that the problems both FERC and Maryland are trying to address in each situation represent the importance of the concurrent jurisdiction and cooperative federalism that the Federal Power Act envisions," said Natural Resources Defense Council attorney Allison Clements, although she noted there are "important distinctions" differentiating the cases.

The linked Maryland cases the court today agreed to hear later this term are *W. Kevin Hughes v. PPL*

EnergyPlus LLC and *CPV Maryland v. PPL EnergyPlus*. Hughes is the chairman of the Maryland Public Service Commission.

The high court has not yet declared whether it will weigh in on two separate but related cases that involve a similar program in New Jersey.

Both states developed programs that sought to encourage energy generation by setting up programs where new plants were ensured fixed contract rates and stable revenues from retail electricity purchasers. And both states' programs were struck down by federal appeals courts, where judges found that the incentives infringed on FERC's jurisdiction over wholesale rates for electricity and transmission that crosses state lines.

Maryland, New Jersey and Commercial Power Ventures of Maryland had asked the high court to reinstate those programs. State officials argued that the lower courts had inappropriately hampered their ability to ensure adequate and affordable electricity generation and failed to preserve states' authority over electricity generation within their borders.

Last month, U.S. Solicitor General Donald Verrilli said both the Maryland and New Jersey programs were unlawful and urged the court to leave in place the rulings that struck them down. Despite states' contentions that the lower courts' decisions will stifle clean energy generation, he said, "both courts went out of their way to emphasize that their pre-emption decisions were limited to the specific circumstances of the New Jersey and Maryland programs" (*Greenwire*, Sept. 18).

Clements of NRDC said today, "The Supreme Court's consideration of this case is consistent with the recognition that states must be able to pursue their own energy policy agendas -- specifically clean energy agendas -- in a manner that complements FERC's authority."

The court's decision to hear the Maryland case is "good news," said National Association of Regulatory Utility Commissioners general counsel Brad Ramsay. NARUC filed an amicus brief urging the Supreme Court to reverse the lower court's ruling. "If nothing else -- it means petitioners get one more shot in the 'batter's box' to make our case. Plus, the most logical implication of the grant is that at least four justices don't like some aspect of the decision below," Ramsay added.

It takes the votes of four Supreme Court justices to grant review of a case.

Calif. clean water case

In a separate denial issued today, the Supreme Court refused to hear an appeal in the case *Conway v. State Water Resources Control Board*.

In that case, the owners of private property on McGrath Lake in Ventura County, Calif., challenged how regulators had established the "total maximum daily load" of pollutants allowed in the lake.

A California appeals court found that regulators' establishment of pollutant limits was in line with the Clean Water Act, and the California Supreme Court declined to review the case.

AIR POLLUTION:

Greens decry ozone limit as easier lift than Bush-era reg

Amanda Reilly, E&E reporter

Published: Monday, October 19, 2015

Key green allies are delivering a scathing critique about the new ozone standard finalized by the Obama administration earlier this month: President Obama is letting industry off easy compared to the Bush administration.

Green groups contend that fewer counties are likely to be named out of compliance under U.S. EPA's final standard than were designated in noncompliance under the 2008 limit set during the George W. Bush administration.

While they disagreed with the Bush administration's standard, environmentalists also say that the Republican president set a bigger safety cushion based on analysis of harmful levels of ozone.

"This was the weakest option on the table," Terry McGuire, a Washington representative for the Sierra Club, said of the Obama administration's standard. "It's a step in the right direction, but this is not a huge lift for industry."

Industry, however, maintains that the low-hanging fruit of pollution control has already been picked, leaving on the table more costly options for reducing emissions. Background levels of ozone greatly complicate compliance at the new standard, compared with the 2008 standard, according to industry experts.

EPA on Oct. 1 unveiled a final new ambient air quality standard for ground-level ozone of 70 parts per billion, down from the 2008 limit of 75 ppb. The agency based the new limit on a scientific review of negative public health effects linked to ozone (*Greenwire*, Oct. 1).

Ground-level ozone is a key component of smog that's formed when nitrogen oxides and volatile organic compounds react in the presence of sunlight.

Determining compliance with the standard is complex: An area could exceed the standard four times a year for three years before it's considered in violation.

Using that formula, EPA says it expects 213 counties outside of California that monitor air quality to fail to achieve the new limit when it issues designations in 2017. Under the Clean Air Act, states with nonattainment areas will be required to submit pollution control plans to EPA.

But the agency says all but 14 of those counties will meet the standard by 2025 thanks to the Clean Power Plan, mercury standards, emission limitations for cars and trucks, and other air pollution regulations.

According to EPA's regulatory impact analysis, just five coal-fired power plants will have to make changes to reduce levels of NOx pollution.

When the Bush administration lowered the ozone standard from 84 ppb to 75 ppb in 2008, it later labeled 232 counties in whole or in part in "nonattainment." Many of those other regulations were not in place at the time the standard was promulgated.

The Natural Resources Defense Council, a key green ally of the Obama administration, last week pointed to those figures and argued that industry was being let off the hook under the new limit.

"There are far fewer new nonattainment areas required by this standard than by the Bush administration's

standard in 2008," said John Walke, clean air director at NRDC, during a panel last week held by the Environmental Law Institute.

Concerns about compliance, however, helped fuel an aggressive campaign by industry and business groups against the tighter standard.

Cindy Langworthy, a counsel at Hunton & Williams LLP who represents industry clients, pushed back against the contention that the new standard will be an easy lift and said its reach extends beyond the coal industry.

EPA, she argued, is oversimplifying the compliance process when it says most areas will come into compliance by 2025 thanks to other air regulations.

"EPA's assessment," Langworthy said, "that many areas will come into attainment using business-as-usual approaches -- which, by the way, can be pretty costly, including for the electric utility industry -- that assessment is just really not relevant to what areas are going to have to do."

Langworthy also noted that, under the Clean Air Act, most areas around the country will be required to show compliance before 2025.

She also raised concerns that background levels of ozone stemming from the upper atmosphere, overseas pollution and wildfires will complicate efforts to comply. EPA has several mechanisms for addressing air pollution that is out of states' control, but "historically none of these tools has worked very well," she said.

Lorie Schmidt, associate general counsel at EPA, last week said that the concerns about background ozone were overblown and that the agency intended to release a white paper in the coming months on the subject.

Scientific review also under question

Obama's green allies have also blasted the scientific review that underlies the administration's new ozone standard (*Greenwire*, Oct. 2).

EPA said it determined that negative effects occurred in healthy, exercising adults at ozone concentrations of 72 ppb. The agency set a new standard at 70 ppb to provide the margin of safety required by the Clean Air Act.

In comparison, the Bush administration's EPA found that studies showed actual harm from ozone pollution at 80 ppb. The agency set a new standard at 75 ppb to cushion the public from the negative effects.

Walke of NRDC said the Obama administration did "worse" by adopting a 2 ppb margin of safety.

"They merely lowered the standard to 70 rather than to 67 as they would have done had they followed even the example of the Bush administration," he said.

To be sure, green groups were not pleased with the Bush administration's standard when it was set, arguing that the limit was too weak. Environmentalists and public health groups have long argued that the scientific evidence shows ozone levels above 60 ppb are harmful.

Green groups have already said they would likely sue the Obama administration over a 70 ppb standard (*Greenwire*, Sept. 29).

Schmidt at EPA acknowledged that setting a new ozone standard was "very controversial" and defended the administration's decision.

EPA has said the link to negative health effects at levels below 70 ppb is too uncertain to be the basis of a national ambient air quality standard.

"Because of that uncertainty, we did not believe it was appropriate to require complete elimination of exposures to ozone at levels as low as 60," Schmidt said.

CLIMATE:

68 more companies join White House pledge ahead of Paris

Hannah Northey and Jean Chemnick, E&E reporters

Published: Monday, October 19, 2015

Article updated at 2:06 p.m. EDT.

Sixty-eight companies signed on today to a White House-sponsored statement calling for the Paris climate talks to produce a "strong step forward" in controlling warming.

Today's signatories -- which run the gamut from banks to consumer goods companies to coal-invested energy firms -- bring the total number of companies that have signed the American Business Act on Climate Pledge to 81.

The pledge was initiated in July with 13 participants as part of the White House's strategy to show private-sector support ahead of this year's high-stakes round of U.N. negotiations (*E&E Daily*, July 27).

"We recognize that delaying action on climate change will be costly in economic and human terms, while accelerating the transition to a low-carbon economy will produce multiple benefits with regard to sustainable economic growth, public health, resilience to natural disasters, and the health of the global environment," the pledge says.

President Obama will meet with CEOs from five companies that endorsed the pledge: Berkshire Hathaway Energy, the Hershey Co., Pacific Gas and Electric Co., Johnson & Johnson, and Intel Corp. Each has brought a supplier to the meeting, which will focus on "efforts to tackle climate change both in the United States as well as on a global scale," according to the White House.

All signatories have also pledged to bring down their own greenhouse gas emissions and limit waste. The White House said these company-specific pledges include promises to cut heat-trapping emissions by half, slash water usage by as much as 80 percent and transition to 100 percent renewable energy use.

But while energy giants like Berkshire Hathaway Energy, Calpine, General Electric Co., Iberdrola USA and PG&E have signed on to the White House's pledge, large oil and gas players have not. And when asked about their absence on a call today with reporters, White House climate adviser Brian Deese quickly pivoted to discussing the willingness of the U.S. utility sector to join other sectors -- technology, retail and manufacturing -- in slashing their emissions.

"These are companies that are stepping up to recognize the opportunity associated with moving more toward clean energy. I think that's consistent with the conversations that we're having, broadly speaking,

with the American utility sector," he said. "One of the reactions to the Clean Power Plan we've found domestically is that utilities, generally speaking, we're having a very constructive dialogue ... about their own plans to move toward cleaner sources of energy."

Firms that are taking the pledge are endorsing the Obama administration's effort to tackle climate change and calling for an international agreement in Paris later this year, he added.

Negotiators will spend this week in Bonn, Germany, attempting to craft a draft agreement that will form the basis of talks in Paris, and Deese said the United States' business support will help drive those conversations and progress heading into Paris. Levi Strauss, he noted, is pledging to slash emissions by 25 percent by 2020 in office, retail and distribution hubs, while Nike is vowing to use only renewable energy in its facilities by 2025.

Todd Brady, a global environmental and occupational health director for Intel, the largest purchaser of renewable energy in the United States and one of the pledge's signatories, was also on the call. Intel pledged to continue fueling its operations in the United States and internationally with only renewable energy through 2020 and increase its domestic clean energy production.

"We do believe that business and a focus on climate change can go hand in hand," Brady said.

The White House expects another group of companies to sign on to the pledge before the start of the Paris negotiations in six weeks' time, Deese said.

These companies "are also committing to transparently accounting for the emissions and/or clean energy activities they're undertaking," he said. "Part of this effort includes affording greater transparency and greater access to the data that underlies how these companies are operating."

Focus on private sector

Also today, Deese said an independent consortium of long-term investors is announcing a consortium, which will focus predominantly on growth and deployment capital in clean energy.

The new entity, Aligned Intermediary, will announce its intention to spend $1.2 billion in investment capital, and the formal launch will take place next year, Deese said.

Former Department of Energy Loan Programs Office Executive Director Peter Davidson, the consortium's co-founder and CEO, is slated to appear at Secretary of State John Kerry's two-day summit on climate finance tomorrow, where he will provide more details.

When asked why the White House is spending so much time engaging businesses in hopes of greasing the wheels heading into Paris, Deese said industry backing is critical to reaching ambitious and sustainable climate goals and demonstrating it can act on climate threats.

"For some years, President Obama has been making the case that if we make the right choices, we make smart investments in basic research to try and drive down the cost of clean energy," he said. "I think that's what we're starting to see."

Deese said the meeting is part of other climate talks occurring at the White House today, and members of Congress and other stakeholders will also be in attendance. Discussions, he said, will focus on leveling the playing field for American companies and providing them certainty in areas of emerging technologies.

"We're trying to encourage the companies that are participating today to raise up their commitments in the areas of the country where they operate, where they're headquartered, where their employees work," he

said. "We've got companies that operate in every state."

The Obama administration is not alone in striving to show private sector buy-in for a climate accord out of Paris. The private sector is seen as an important contributor of finance for climate change mitigation projects in the developing world. A recent report showed developed nations supplied more than $60 billion in climate finance to poor countries last year, due in large part to private investment.

CEOs from 10 major fossil fuels companies met in Paris last week to call for an "effective" agreement to keep warming to 2 degrees Celsius above preindustrial levels. The goal is laid out in the U.N. Framework Convention on Climate Change, but analysists say current national pledges fall short of meeting it.

The fossil fuels companies, which include BP, Royal Dutch Shell and Statoil, pledged to collaborate on emissions reduction going forward.

"Over the coming years we will collectively strengthen our actions and investments to contribute to reducing the [greenhouse gas] intensity of the global energy mix," they said.

The Union of Concerned Scientists released a statement ahead of the CEOs' appearance urging skepticism.

"Given their track record, the onus is on them to prove to both their shareholders and the public that they are truly serious," said Alden Meyer, the group's director of strategy and policy.

He proposed that any action taken by the fossil industry be evaluated on the basis of whether it calls for absolute limits on emissions, cuts to fossil fuels tax benefits and subsidies, and a carbon tax in developed countries.

And Reuters quoted Laurence Tubiana, French ambassador for the international climate negotiations, as saying fossil fuels companies should be challenged to explain "what is their next business model for the years to come."

FEDERAL AGENCIES:

IG: Give watchdogs access to all records

Kevin Bogardus, E&E reporter

Published: Monday, October 19, 2015

The Department of Justice's internal watchdog is urging Congress to pass legislation to guarantee inspectors general access to all agency records.

In a *Washington Post* op-ed published yesterday, Michael Horowitz, the inspector general for Justice, said agencies have begun to restrict access to records sought under IG investigations. The move comes despite the Inspector General Act stating that the agency watchdogs should have access to all records.

"Without independent access to agency records, our ability as IGs to conduct the kind of sensitive reviews that have resulted in widespread improvements in the effectiveness of government programs will be significantly compromised," wrote Horowitz, who is also chairman of the Council of the Inspectors General on Integrity and Efficiency.

"Allowing officials whose agencies are under review to decide what documents an inspector general can
